**A.** Use MGCP gateways, which support variable-length dial plans  
**B.** Use the @macro on the route pattern  
**C.** Use nested translation patterns to eliminate inter-digit timeout  
**D.** Overlap sending and receiving  
**E.** Add a prefix for all calls that are longer than 10-digits long  
**Answer: D**  
Explanation: If the dial plan contains overlapping patterns, Cisco Unified Communications Manager does not route the call until the interdigit timer expires (even if it is possible to dial a sequence of digits to choose a current match). Check this check box to interrupt interdigit timing when Cisco Unified Communications Manager must route a call immediately. By default, the Urgent Priority check box displays as checked. Unless your dial plan contains overlapping patterns or variable length patterns that contain!, Cisco recommends that you do not uncheck the check box.

**Answer:**

**C**Explanation:Explanation/Reference:Explanation:Explanation:Geolocation routing lets you choose the resources that serve your traffic based on the geographic location of your users, meaning the location from which DNS queries originate. For example, you might want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111. Another possible use is for balancing load across endpoints in a predictable, easy-to-manage way, so that each user location is consistently routed to the same endpoint.
