NEW QUESTION: 1 Which of the following BEST describes the type of attack that is occurring? (Select TWO).
A. Xmas attack
B. Backdoor
C. Spear phishing
D. Replay
E. ARP attack
F. DNS spoofing
G. Man-in-the-middle
Answer: E, F
Explanation: We have a legit bank web site and a hacker bank web site. The hacker has a laptop connected to the network. The hacker is redirecting bank web site users to the hacker bank web site instead of the legit bank web site. This can be done using two methods: DNS Spoofing and ARP Attack (ARP Poisoning).
A: DNS spoofing (or DNS cache poisoning) is a computer hacking attack, whereby data is introduced into a Domain Name System (DNS) resolver's cache, causing the name server to return an incorrect IP address, diverting traffic to the attacker's computer (or any other computer). A domain name system server translates a human-readable domain name (such as example.com) into a numerical IP address that is used to route communications between nodes. Normally if the server doesn't know a requested translation it will ask another server, and the process continues recursively. To increase performance, a server will typically remember (cache) these translations for a certain amount of time, so that, if it receives another request for the same translation, it can reply without having to ask the other server again. When a DNS server has received a false translation and caches it for performance optimization, it is considered poisoned, and it supplies the false data to clients. If a DNS server is poisoned, it may return an incorrect IP address, diverting traffic to another computer (in this case, the hacker bank web site server).
E: Address Resolution Protocol poisoning (ARP poisoning) is a form of attack in which an attacker changes the Media Access Control (MAC) address and attacks an Ethernet LAN by changing the target computer's ARP cache with a forged ARP request and reply packets. This modifies the layer -Ethernet MAC address into the hacker's known MAC address to monitor it. Because the ARP replies are forged, the target computer unintentionally sends the frames to the hacker's computer first instead of sending it to the original destination. As a result, both the user's data and privacy are compromised. An effective ARP poisoning attempt is undetectable to the user. ARP poisoning is also known as ARP cache poisoning or ARP poison routing (APR).

NEW QUESTION: 2 Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in

each question in this series. You maintain a Microsoft SQL Server instance that contains the following databases SalesDb1, SalesDb2, and SalesDb3. Each database has table named Products and Sales. The following table shows the configuration of each database. The backup strategies for each database are described in the following table. Each full or differential backup operation writes into a new file and uses a different sequence number. You observe the following database corruption issues. SalesDb3 reports a number of database corruption issues related to error 823 and 824 when reading data pages. You must display the following information about the corrupted pages: * database name * impacted file id * impacted file physical name * impacted page id * event type that identifies the error type * error count

Users report performance issues when they run queries against You plan to monitor query statistics and execution plans for SalesDb2 by using Query Store. The monitoring strategy must meet the following requirements: * Perform automatic data cleanup when query store disk usage reaches 500 megabyte (MB). * Capture queries based on resource consumption. * Use a stale query threshold value of 60 days. The query optimizer generates suboptimal execution plans for a number of queries on the Sales table in SalesDb2. You will create a maintenance plan that updates statistics for the table. The plan should only update statistics that were automatically created and have not been updated for 30 days. The update should be based on all data in the table. You need to write the query the maintenance plan will use to update the statistics. Which four Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

Answer: Explanation: Explanation Step 1: Use SalesDB2... We specify the specific database SalesDB2, not the master. Step 2: Step 3: From scenario: The plan should only update statistics that were automatically created and have not been updated for 30 days. Step 4: Declare the cursor using WITH FULLSCAN.
