(Choose two.)**A.** Configure domain name using ip domain-name command**B.** Generate a key using crypto key generate rsa**C.** Configure a DHCP host for the router using dhcpname#configure terminal**D.** Generate enterprise CA self-sign certificate**Answer: A, B**Explanation:Here are the steps:  
\* Configure a hostname for the router using these commands.yourname#configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.yourname (config)#hostname LabRouterLabRouter(config)#\*Configure a domain name with the ip domain-name command followed bywhatever you would like your domain name to be. I used CiscoLab.com.  
LabRouter(config)#ip domain-name CiscoLab.com\*We generate a certificate that will be used to encrypt the SSH packets using the crypto key generate rsa command.Take note of the message that is displayed right after we enter this command: "The name for the keys will be: LabRouter.CiscoLab.com" -- it combines the hostname of the router along with the domain name we configured to get the name of the encryption key generated; this is why it was important for us to, first of all, configure a hostname then a domain name before we generated the keys.Reference:
