NEW QUESTION: 1A. Option CB. Option AC. Option B**Answer: C**

NEW QUESTION: 2A. VXLAN failure**B.** vCenter Server failure**C.** Disk array failure**D.** ESXi host failure**E.** Network failure**Answer: C,E**

NEW QUESTION: 3Refer to the exhibit.Which two statements are correct? (Choose two.)**A.** Logging is enabled for the access list.**B.** Zone-Based Firewall is configured on the router.**C.** The Telnet connection is successfully set up.**D.** Private is an identification of that ACE.**E.** The packet is received on the private interface.**Answer: A,D****Explanation:**The log and log-input Access Control Entry Options The log and log-input options apply to an individual ACE and cause packets that match the ACE to be logged. The log-input option enables logging of the ingress interface and source MAC address in addition to the packet's source and destination IP addresses and ports. The first packet logged via the log or log-input options will generate a syslog message. There are two scenarios in which subsequent log messages will not be sent immediately. If the log-enabled ACE matches another packet with identical characteristics to the packet that generated a log message, the number of packets matched is incremented and then reported at five-minute intervals. Similarly, if any log-enabled ACE in any ACL on any interface matches a packet within one second of the initial log message, the match or matches are counted for five minutes and then reported. These periodic updates will contain the number of packets matched since the previous message.**Reference**
