`DECLARE @traceEventId int = 122;DECLARE @traceColumnIdForTextData int = 1;DECLARE @durationFilter bigint = 100;DECLARE @databaseId int;SELECT @databaseId = DB_ID('MyDatabase');`  
**Answer:** Explanation:ExplanationThe following system stored procedures are used to define and manage traces:  
\* `sp_trace_create` is used to define a trace and specify an output file location as well as other options that I'll cover in the coming pages. This stored procedure returns a handle to the created trace, in the form of an integer trace ID.  
\* `sp_trace_setevent` is used to add event/column combinations to traces based on the trace ID, as well as to remove them, if necessary, from traces in which they have already been defined.  
\* `sp_trace_setfilter` is used to define event filters based on trace columns.  
\* `sp_trace_setstatus` is called to turn on a trace, to stop a trace, and to delete a trace definition once you're done with it. Traces can be started and stopped multiple times over their lifespan.
