NEW QUESTION: 3Refer to the exhibit.Host A has sent an ARP message to the default gateway IP address 10.10.10.1. Which statement is true?**A.** DSw1 replies with the MAC address of the next AVF.**B.** DSw2 replies with the IP address of the next AVF.**C.** DSw2 replies with the MAC address of the next AVD.**D.** Because of the invalid timers that are configured, DSw2 does not reply.**E.** DSw1 replies with the IP address of the next AVF.**F.** Because of the invalid timers that are configured, DSw1 does not reply.**Answer: C****Explanation:**The Gateway Load Balancing Protocol (GLBP) is a Cisco-proprietary protocol designed to overcome the limitations of existing redundant router protocols. Some of the concepts are the same as with HSRP/VRRP, but the terminology is different and the behavior is much more dynamic and robust.The trick behind this load balancing lies in the GLBP group. One router is elected the active virtual gateway (AVG). This router has the highest priority value, or the highest IP address in the group, if there is no highest priority. The AVG answers all ARP requests for the virtual router address.Which MAC address it returns depends on which load-balancing algorithm it is configured to use. In any event, the virtual MAC address supported by one of the routers in the group is returned. According to exhibit, Router Company2 is the Active Virtual Gateway (AVG) router because it has highest IP address even having equal priority. When router Company1 sends the ARP message to 10.10.10.1 Router Company2 will reply to Company1 as a Active Virtual Router.Reference: Configuring GLBP (http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp_glb.html)

NEW QUESTION: 4An organization requires a second technician to verify changes before applying them to network devices. When checking the configuration of a network device, a technician determines that a coworker has improperly configured the AS number on the device. This would result in which of the following?**A.** Spanning tree ports in flooding mode**B.** The OSPF not-so-stubby area is misconfigured**C.** Reduced wireless network coverage**D.** BGP

routing issues
Answer: D
Explanation: BGP (Border Gateway Protocol) is used to route data between autonomous systems (AS's) A collection of networks that fall within the same administrative domain is called an autonomous system (AS). The routers within an AS use an interior gateway protocol, such as the Routing Information Protocol (RIP) or the Open Shortest Path First (OSPF) protocol, to exchange routing information among themselves. At the edges of an AS are routers that communicate with the other AS's on the Internet, using an exterior gateway protocol such as the Border Gateway Protocol (BGP).
