NEW QUESTION: 1 Refer to the exhibit. R1 in performing mutual redistribution, but OSPF routes from R3 are unable to reach R2. Which three options are possible reasons for this behavior? (Choose three.)
A. R2 is configured to advertise OSPF routes with a metric of 16.
B. The OSPF version supports only classful networks.
C. R3 and R1 have the same router ID.
D. R1 is filtering OSPF routes when redistributing into RIP.
E. R1 and R3 have an MTU mismatch.
F. R1 requires a default metric to redistribute RIP.
Answer: A, D, F
Explanation: A. RIP requires a default metric to be specified when redistributing routes into that protocol. A default metric in a "no default-metric" configuration that is given the RIP process a metric it can work with. The OSPF metric of 16 is not understood by RIP, since RIP's default metric is hop count. We've got to give RIP a metric it understands when redistributing routes into that protocol, so let's go back to R1 and do so.
C. Filtering routes in another explanation, if the routes to R2 are being filtered from being advertised to R1.
F. If the default metric is set to 16, then the routes will have reached the maximum hop count when redistributed to RIP. The max hop count for RIP is 16.
