Explanation: By not revealing the internal IP addresses, NAT adds some security to the inside network > F is correct. NAT has to modify the source IP addresses in the packets -> E is not correct. Connection from the outside of the network through a "NAT" network is more difficult than a more network because IP addresses of inside hosts are hidden -> C is not correct. In order for IPsec to work with NAT we need to allow additional protocols, including Internet Key Exchange (IKE), Encapsulating Security Payload (ESP) and Authentication Header (AH) -> more complex -> A is not correct. By allocating specific public IP addresses to inside hosts, NAT eliminates the need to readdress the inside hosts -> B is correct. NAT does conserve addresses but not through host MAC-level multiplexing. It conserves addresses by allowing many private IP addresses to use the same public IP address to go to the Internet -> C is not correct.
