BLOBで GetSharedAccessSignature を呼び出し、結果のリンクを使用します。 **D.**

SharedAccessBlobPolicyを作成し、有効期限を今日から2週間に設定します。

BLOBで GetSharedAccessSignature を呼び出し、結果のリンクを使用します。 **Answer: B**

Explanation: Scenario: Processing is performed by an Azure Function that uses version 2 of the Azure Function runtime. Once processing is completed, results are stored in Azure Blob Storage and an Azure SQL database. Then, an email summary is sent to the user with a link to the processing report. The link to the report must remain valid if the email is forwarded to another user.

Create a stored access policy to manage signatures on a container's resources, and then generate the shared access signature on the container, setting the constraints directly on the signature.

Code example: Add a method that generates the shared access signature for the container and returns the signature URI.

```
static string GetContainerSasUri(CloudBlobContainer container) {  
    //Set the expiry time and permissions for the container.  
    //In this case no start time is specified, so the shared access signature becomes valid immediately.  
    SharedAccessBlobPolicy sasConstraints = new SharedAccessBlobPolicy();  
    sasConstraints.SharedAccessExpiryTime =  
    DateTimeOffset.UtcNow.AddHours(24);  
    sasConstraints.Permissions =
```

```
    SharedAccessBlobPermissions.List | SharedAccessBlobPermissions.Write;  
    //Generate the shared access signature on the container, setting the constraints directly on the signature.
```

```
    string sasContainerToken = container.GetSharedAccessSignature(sasConstraints);  
    //Return the URI string for the container, including the SAS token.  
    return container.Uri + sasContainerToken;  
}
```

Incorrect Answers: C: Call GetSharedAccessSignature on the container, not on the blob.

NEW QUESTION: 3A. Option **AB.** Option **DC.** Option **CD.** Option **B** **Answer: B** Explanation:

[http://technet.microsoft.com/en-us/library/cc785665\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc785665(v=ws.10).aspx) Order of processing

settings This section provides details about the order in which Group Policy settings for users

and computers are processed. Group Policy settings are processed in the following order: 1. Local Group Policy object-Each computer has exactly one Group Policy object that is stored locally.

This processes for both computer and user Group Policy processing. 2. Site-Any GPOs that have

been linked to the site that the computer belongs to are processed next. 3. Domain-Processing

of multiple domain-linked GPOs is in the order specified by the administrator, on the Linked

Group Policy Objects tab for the domain in GPMC. 4. Organizational units-GPOs that are linked to

the organizational unit that is highest in the Active Directory hierarchy are processed first, then

GPOs that are linked to its child organizational unit, and so on. Finally, the GPOs that are linked

to the organizational unit that contains the user or computer are processed. This order means

that the local GPO is processed first, and GPOs that are linked to the organizational unit of

which the computer or user is a direct member are processed last, **which overwrites settings

in the earlier GPOs if there are conflicts. ** (If there are no conflicts, then the earlier and later

settings are merely aggregated.)

NEW QUESTION: 4 Which of the following attributes are typical for early models of statistical credit analysis? **A.** The underlying default assumptions failed to develop relatively simple

formulas for the determination of portfolio credit risk. **B.** The underlying default assumptions were analytically inconvenient. **C.** These models assumed the default of any obligor was independent of the default of any other. **D.** These models effectively incorporated herd behavior. **Answer: C**
