NEW QUESTION: 1 Overview General Overview ADatum Corporation has offices in Miami and Montreal. The network contains a single Active Directory forest named adatum.com. The offices connect to each other by using a WAN link that has 5-ms latency. A: Datum standardizes its database platform by using SQL Server 2014 Enterprise edition. Databases Each office contains databases named Sales, Inventory, Customers, Products, Personnel, and Dev. Servers and databases are managed by a team of database administrators. Currently, all of the database administrators have the same level of permissions on all of the servers and all of the databases. The Customers database contains two tables named Customers and Classifications. The following graphic shows the relevant portions of the tables: The following table shows the current data in the Classifications table: The Inventory database is updated frequently. The database is often used for reporting. A full backup of the database currently takes three hours to complete. Stored Procedures A stored procedure named USP_1 generates millions of rows of data for multiple reports. USP_1 combines data from five different tables from the Sales and Customers databases in a table named Table1. After Table1 is created, the reporting process reads data from Table1 sequentially several times. After the process is complete, Table1 is deleted. A stored procedure named USP_2 is used to generate a product list. The product list contains the names of products grouped by category. USP_2 takes several minutes to run due to locks on the tables the procedure accesses. The locks are caused by USP_1 and USP_3. A stored procedure named USP_3 is used to update prices. USP_3 is composed of several UPDATE statements called in sequence from within a transaction. Currently, if one of the UPDATE statements fails, the stored procedure fails. A stored procedure named USP_4 calls stored procedures in the Sales, Customers, and Inventory databases. The nested stored procedures read tables from the Sales, Customers, and Inventory databases. USP_4 uses an EXECUTE AS clause. All nested stored procedures handle errors by using structured exception handling. A stored procedure named USP_5 calls several stored procedures in the same database. Security checks are performed each time USP_5 calls a stored procedure. You suspect that the security checks are slowing down the performance of USP_5. All stored procedures accessed by user applications call nested stored procedures. The nested stored procedures are never called directly. Design Requirements Data Recovery You must be able to recover data from the Inventory database if a storage failure occurs. You have a Recovery Time Objective (RTO) of 5 minutes. You must be able to recover data from the Dev database if data is lost accidentally. You have a Recovery Point Objective (RPO) of one day. Classification Changes You plan to

change the way customers are classified. The new classifications will have four levels based on the number of orders. Classifications may be removed or added in the future. Management requests that historical data be maintained for the previous classifications. Security A group of junior database administrators must be able to manage security for the Sales database. The junior database administrators will not have any other administrative rights. A: Datum wants to track which users run each stored procedure. Storage A Datum has limited storage. Whenever possible, all storage space should be minimized for all databases and all backups. Error Handling There is currently no error handling code in any stored procedure. You plan to log errors in called stored procedures and nested stored procedures. Nested stored procedures are never called directly. You need to recommend a solution to minimize the amount of time it takes to execute USP_5. What should you include in the recommendation? **A.** Copy USP.5 to each database. **B.** Enable cross-database chaining. **C.** Use the EXECUTE AS clause in USP_5. **D.** Use a server role to group all logins. **Answer: B** Explanation: Explanation Scenario: A stored procedure named USP_5 changes data in multiple databases. Security checks are performed each time USP_5 accesses a database. - Cross-database ownership chaining occurs when a procedure in one database depends on objects in another database. A cross-database ownership chain works in the same way as ownership chaining within a single database, except that an unbroken ownership chain requires that all the object owners are mapped to the same login account. If the source object in the source database and the target objects in the target databases are owned by the same login account, SQL Server does not check permissions on the target objects.

NEW QUESTION: 2 The Draft-Rosen S-PMSI address range is configured for 32 group addresses. What happens if there are more than 32 customer multicast flows that exceed the threshold configured for the MVPN? **A.** Traffic for the 33rd multicast flow is dropped. **B.** The source PE reassigns the S-PMSI with the smallest flow to the new multicast flow. Traffic for the smaller flow is transmitted on the I-PMSI. **C.** The source PE re-uses an S-PMSI that is currently in use for the 33rd flow. Traffic for both flows is sent on the same S-PMSI. **D.** Traffic for the 33rd multicast flow is transmitted on the I-PMSI. **Answer: C**

NEW QUESTION: 3 Which statement is true regarding the cost cutoff date in Cost Accounting? **A.** Transactions with a transaction date before the cost cutoff date will not be processed until the cost cutoff date is changed to a date that is before the transaction date. **B.** It only affects whether or not you can process a cost adjustment. **C.** Transactions with a transaction date after the cost cutoff date will not be processed. These transactions will never be processed in any subsequent cost processor run. **D.** Transactions with a transaction date after the cost cutoff date will not be processed until the cost cutoff date is changed to a date that is later than the transaction date. **Answer: D**
