(2 개를 선택하십시오.) **A.** 마스터 계정에서 조직을 만듭니다. 마스터 계정에서 보조 계정으로 초대권을 보냅니다. 초대권을 수락하고 OU를 만듭니다. **B.** 마스터 계정과 보조 계정간에 VPC 피어링 연결을 만듭니다. In terms of boundaries, we have the following three boundaries: 1. SCP 2. User/Role boundaries 3. Session boundaries (ex. AssumeRole ...) In terms of actual permission granting, we have the following: 1. Identity Policies 2. Resource Policies

NEW QUESTION: 2 Which tool can be used to migrate and import users into Cisco Unity Connection? **A.** COBRAS **B.** SFTPC **C.** .xls **D.** TFTP **Answer: A**

NEW QUESTION: 3 Drag and drop the threat-mitigation techniques from the left onto the types of threat or attack they mitigate on the right. **Answer:** Explanation: Explanation Double-Tagging attack: In this attack, the attacking computer generates frames with two 802.1Q tags. The first tag matches the native VLAN of the trunk port (VLAN 10 in this case), and the second matches the VLAN of a host it wants to attack (VLAN 20). When the packet from the attacker reaches Switch A, Switch A only sees the first VLAN 10 and it matches with its native VLAN 10 so this VLAN tag is removed. Switch A forwards the frame out all links with the same native VLAN 10. Switch B receives the frame with an tag of VLAN 20 so it removes this tag and forwards out to the Victim computer. Note: This attack only works if the trunk (between two switches) has the same native VLAN as the attacker. To mitigate this type of attack, you can use VLAN access control lists (VACLs, which applies to all traffic within a VLAN. We can use VACL to drop attacker traffic to specific victims/servers) or implement Private VLANs. ARP attack (like ARP poisoning/spoofing) is a type of attack in which a malicious actor sends falsified ARP messages

over a local area network as ARP allows a gratuitous reply from a host even if an ARP request was not received. This results in the linking of an attacker's MAC address with the IP address of a legitimate computer or server on the network. This is an attack based on ARP which is at Layer 2. Dynamic ARP inspection (DAI) is a security feature that validates ARP packets in a network which can be used to mitigate this type of attack.

However, after applying the profile to your firewall policy, clients running Skypecan still connect and use the application. What are two causes of this problem? (Choose two.)
A. The application control database is not updated.
B. The FakeSkype.botnet signature is included on your application control sensor.
C. A client on the network was already connected to the Skype network and serves as relay prior to configuration changes to block Skype
