NEW QUESTION: 1 Which of the following is NOT an asymmetric key algorithm?
A. Elliptic Curve Cryptosystem (ECC)
B. El Gamal
C. Data Encryption System (DES)
D. RSA
Answer: C
Explanation: Data Encryption Standard (DES) is a symmetric key algorithm. Originally developed by IBM, under project name Lucifer, this 128-bit algorithm was accepted by the NIST in 1974, but the key size was reduced to 56 bits, plus 8 bits for parity. It somehow became a national cryptographic standard in 1977, and an American National Standard Institute (ANSI) standard in 1978. DES was later replaced by the Advanced Encryption Standard (AES) by the NIST. All other options are asymmetric algorithms. NEW QUESTION: 2 How should a router that is being used in a Frame Relay network be configured to keep split horizon issues from preventing routing updates?
A. Configure each Frame Relay circuit as a point-to-point line to support multicast and broadcast traffic.
B. Configure a single subinterface to establish multiple PVC connections to multiple remote router interfaces.
C. Configure a separate subinterface for each PVC with a unique DLCI and subnet assigned to the subinterface.
D. Configure many subinterfaces in the same subnet.
Answer: C
Explanation: If you have a serial port configured with multiple DLCIs connected to multiple remote sites, split horizon rules, stop route updates received on an interface from being sent out the same interface. By creating subinterfaces for each PVC, you can avoid the split horizon issues when using Frame Relay.

NEW QUESTION: 3 You work as a network engineer for a Company. Study the exhibit carefully. In this network, R1 is redistributing 10.1.5.0/24 into OSPF, and R2 is originating 10.1.4.0/24 as an internal route. R6 has received packets destined to 10.1.4.1 and 10.1.5.1. Which statement is true about the path or paths these two packets will take?
A. The packet destined to 10.1.5.1 will follow the optimum path through the network, R4 to R1, while the packet destined to 10.1.4.1 will follow a suboptimal path through the network.
B. Both packets will follow optimal paths through the network to their destinations.
C. The packet destined to 10.1.4.1 will follow an

optimal path through the network, while the packet destined to 10.1.5.1 will follow a suboptimal path through the network. There is not enough information provided to determine which packet will take an optimal or suboptimal path through the network. **Answer: A**

Explanation: Below is the configuration information for each router in the example

Configure OSPF Interface Parameters Our OSPF implementation allows you to alter certain
interface-specific OSPF parameters, as needed. You are not required to alter any of these
parameters, but some interface parameters must be consistent across all routers in an
attached network. Those parameters are controlled by the ip ospf hello-interval, ip ospf
deadinterval, and ip ospf authentication-key commands. Therefore, be sure that if you do
configure any of these parameters, the configurations for all routers on your network have
compatible values. In interface configuration mode, use any of the following commands to
specify interface parameters as needed for your network: Reference
