A. Stores minimum and maximum values for a 1 MB region
B. Is a standard database index
C. Can be used to eliminate cells from queries
D. Persists through a cell reboot
Answer: A
Explanation: In Oracle Database 11gR2 a new feature called the Exadata Storage Index has been introduced. The storage index contains a summary of the data distribution on the disk and provides an additional method to eliminate unnecessary disk IO. Each disk in the Exadata storage cell is divided into equal sized pieces called storage regions (default 1MB). There is an index entry for every storage region (1MB of data stored on disk). Each entry contains the minimum and maximum value for columns seen in 'where' clause predicates.
