NEW QUESTION: 1A. Option CB. Option DC. Option BD. Option AAnswer: D

NEW QUESTION: 2Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1that runs Windows Server 2012 R2.On a server named Server2, you perform a Server Core Installation of Windows Server 2012 R2. You join Server2 to the contoso.com domain. You need to ensure that you can manage Server2 by using the Computer Managementconsole on Server1.What should you do on Server2?**A.** Run the Disable-NetFirewallRulecmdlet.**B.** Run sconfig.exe and configure remote management.**C.** Run the Enable-NetFirewallRulecmdlet.**D.** Run sconfig.exe and configure the network settings.

Answer: CExplanation:As we can see on the following screenshot, Remote Management is enabled by default on a new Server Coreinstallation of 2012 (so we don't have to configure it on Server2) BUT that's not enough as it only enables WinRM-based remote management (and computer management is not WinRM- based of course). To enable the remotemanagement from an MMC (such as server manager, or computer manager), we have to enable exception rules in theFirewall, which can be done, amongst other ways, using Powershell and the Enable-NetFirewallRulecmdlet.<http://technet.microsoft.com/en-us/library/jj554869.aspx> Enable-NetFirewallRuleDetailed DescriptionThe Enable-NetFirewallRulecmdlet enables a previously disabled firewall rule to be active within the computer or a group organizational unit. This cmdlet gets one or more firewall rules to be enabled with the Name parameter(default), the DisplayName parameter, rule properties, or by associated filters or objects. The Enabled parameter forthe resulting queried rules is set to True.

NEW QUESTION: 3Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets the stated goals.Your network contains an Active Directory domain named contoso.com. The domain contains a DNS server named Server1. All client computers run Windows 10.On Server1, you have the following zone configuration.You need to ensure that all of the client computers in the domain perform DNSSEC validation for the fabrikam.com namespace.Solution: From Windows PowerShell on Server1, you run the Add-DnsServerTrustAnchor cmdlet.Does this meet the goal?**A.** Yes**B.** No**Answer: B**Explanation: The Add-DnsServerTrustAnchor command adds a trust anchor to a DNS server. A trust anchor (or trust "point") is a public cryptographic key for a signed zone. Trust anchors must be configured on every non-authoritative DNS server that will attempt to validate DNS data.Trust

Anchors have no direct relation to DSSEC validation.References:
