NEW QUESTION: 1 DRAG DROP A SharePoint environment includes an enterprise search application. You are configuring the search application crawl schedule for a specific farm. You plan to configure the crawl schedule at set intervals of 15 minutes on a continuous basis. The relevant information for the farm is shown in the following graphic. You need to ensure that search results are fresh and up-to-date for all SharePoint sites in the environment. Which Windows PowerShell cmdlets should you run? (To answer, drag the appropriate cmdlets to the correct variable or variables in the answer area. Each cmdlet may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.)
Select and Place:
Answer: Explanation: Explanation: Changed from gerfield01 comment : Read MOC 70-331 Page 391
If you enable continuous crawling, you do not configure incremental or full crawls. When you select the option to crawl continuously, the content source is crawled every 15 minutes.----- OLD COMMENT -----Note:
Get-SPEnterpriseSearchServiceApplication Returns the search service application for a farm.
-----EXAMPLE-----
\$ssa = Get-SPEnterpriseSearchServiceApplication Identity MySSA
This example obtains a reference to a search service application named MySSA.
Example2:-----EXAMPLE-----
\$searchapp = Get-SPEnterpriseSearchServiceApplication " SearchApp1" \$contentsource = Get-SPEnterpriseSearchCrawlContentSource -SearchApplication \$searchapp -Identity "Local SharePoint Sites" \$contentsource.StartFullCrawl()
This example retrieves the default content source for the search service application, SearchApp1, and starts a full crawl on the content source.
*Set-SPEnterpriseSearchCrawlContentSource Sets the properties of a crawl content source for a Search service application. This cmdlet contains more than one parameter set. You may only use parameters from one parameter set, and you may not combine parameters from different parameter sets. For more information about how to use parameter sets, see Cmdlet Parameter Sets. The Set-SPEnterpriseSearchCrawlContentSource cmdlet updates the rules of a crawl content source when the search functionality is initially configured and after any new content source is added. This cmdlet is called once to set the incremental crawl schedule for a content source, and it is called again to set a full crawl schedule.
*Incorrect:
Get-SPEnterpriseSearchCrawlContentSource Returns a crawl content source. The Get-SPEnterpriseSearchCrawlContentSource cmdlet reads the content source when the rules of content source are created, updated, or deleted, or reads a CrawlContentSource object when the search functionality is initially configured and after any new content source is added.

NEW QUESTION: 2A. Option CB. Option AC. Option DD. Option B
Answer: D Explanation: A Virtual Private Cloud (VPC) is a virtual network dedicated to the user's AWS account. A user can

create a subnet with VPC and launch instances inside that subnet. If the user has created a public private subnet, the instances in the public subnet can receive inbound traffic directly from the internet, whereas the instances in the private subnet cannot. If these subnets are created with Wizard, AWS will create a NAT instance of a smaller or higher size, respectively. The VPC has an implied router and the VPC wizard updates the main route table used with the private subnet, creates a custom route table and associates it with the public subnet.

NEW QUESTION: 3A. Option BB. Option AC. Option CD. Option D**Answer: B,C**
