Topic 2, Coho WineryCase Study:OverviewThis is a case study. Case studies are not timed separately. You can use as much exam time as you would like to complete each case. However, there may be additional case studies and sections on this exam. You must manage your time to ensure that you are able to complete all questions included on this exam in the time provided. To answer the questions included in a case study, you will need to reference information that is provided in the case study. Case studies might contain exhibits and other resources that provide more information about the scenario that is described in the case study. Each question is independent of the other questions in this case study.At the end of this case study, a review screen will appear. This screen allows you to review your answers and to make changes before you move to the next section of the exam. After you begin a new section, you cannot return to this section.To start the case studyTo display the first question in this case study, click the Next button Use the buttons in the left pane to explore the content of the case study before you answer the questions. Clicking these buttons displays information such as business requirements, existing environment, and problem statements. If the case study has an All Information tab, note that the information displayed is identical to the information displayed on the subsequent tabs. When you are ready to answer a question, click the Question button to return to the question.LabelMaker appCoho Winery produces, bottles, and distributes a variety of wines globally. You are a developer implementing highly scalable and resilient applications to support online order processing by using Azure solutions.Coho Winery has a LabelMaker application that prints labels for wine bottles. The application sends data to several printers. The application consists of five modules that run independently on virtual machines (VMs). Coho Winery plans to move the application to Azure and continue to support label creation. External partners send data to the LabelMaker application to include artwork and text for custom label designs.RequirementsDataYou identify the following requirements for data management and manipulation:* Order data is stored as nonrelational JSON and must be

queried using Structured Query Language (SQL). * Changes to the Order data must reflect immediately across all partitions. All reads to the Order data must fetch the most recent writes. SecurityYou have the following security requirements: * Users of Coho Winery applications must be able to provide access to documents, resources, and applications to external partners. * External partners must use their own credentials and authenticate with their organization's identity management solution. * External partner logins must be audited monthly for application use by a user account administrator to maintain company compliance. * Storage of e-commerce application settings must be maintained in Azure Key Vault. * E-commerce application sign-ins must be secured by using Azure App Service authentication and Azure Active Directory (AAD). * Conditional access policies must be applied at the application level to protect company content. * The LabelMaker application must be secured by using an AAD account that has full access to all namespaces of the Azure Kubernetes Service (AKS) cluster. LabelMaker appAzure Monitor Container Health must be used to monitor the performance of workloads that are deployed to Kubernetes environments and hosted on Azure Kubernetes Service (AKS). You must use Azure Container Registry to publish images that support the AKS deployment. ArchitectureIssuesCalls to the Printer API App fall periodically due to printer communication timeouts. Printer communication timeouts occur after 10 seconds. The label printer must only receive up to 5 attempts within one minute. The order workflow fails to run upon initial deployment to Azure. Order.JsonRelevant portions of the app files are shown below. Line numbers are included for reference only. The JSON file contains a representation of the data for an order that includes a single item.

NEW QUESTION: 2 Which information of the data frame is judged by the VLANIF interface to perform Layer 2 forwarding or Layer 3 forwarding?
A. Source IP **B.** Destination podD Source MAC **C.** Destination MAC **Answer: C**

NEW QUESTION: 3 **A.** Option **C**. Option **A**. Option **D**. Option **B** **Answer: A** Explanation: Topic 4, WingTip Toys General Background You are a data architect for WingTip Toys. The company uses SQL Server 2012 Enterprise edition. SQL Server Analysis Services (SSAS) and SQL Server Reporting Services (SSRS) are installed on separate servers. Data Warehouse The company's data warehouse initially contained less than 100 MB and 100 million rows of data from only one data source. It now contains more than 10 TB and 10 billion rows of data, in 25 tables, from 12 data sources. The largest table in the data warehouse, the factOrders table, contains 5 TB of data. The factOrders table contains three date keys: OrderDateKey InvoiceDateKey, and ShipDateKey. The data warehouse server has 1 TB of RAM. Memory usage is currently at 20 percent. One billion rows of data are added to the data warehouse each month. New data is copied each night from the data sources into SQL Server staging tables, and existing records are not updated. The largest data set is order information, which is loaded in parallel into multiple staging tables, one for each data source. All the staging tables have the same structure and belong to the same filegroup as the factOrders table. The dimCustomers table stores customer information that may change over time. Data Models You are developing three SSAS databases, as described in the following table. Reporting Business users frequently generate reports in Microsoft Excel by using PowerPivot. The PowerPivot Management Dashboard does not currently display any usage data. Several SSRS reports exist that use the data warehouse as a source. The data warehouse queries are aggregate queries that use the factOrders table and one or more dimension tables. All SSRS data sources use Integrated Windows authentication. SSRS displays a security access error message when managers run SSRS reports based on the Operations database. Reporting performance has become unacceptably slow. Business Requirements Improve the query speed of the SSRS reports. Allow business users to create reports by using PowerPivot and Power View. Ensure that all users other than business users can view metadata for the Customers dimension. Ensure that business users cannot view metadata for the Customers dimension. Technical Requirements Modify the tables in the data warehouse to minimize aggregate query processing time. Minimize disk storage in the data

warehouse.Ensure that all multidimensional models process data as quickly as possible.Create a fact table named factCustomerContact in the data warehouse to store the contactdate, customer key, and communication type for each instance of customer contact.Store the history of customer information changes in the dimCustomers table.Move data from the staging tables into the factOrders table as quickly as possible. Whencreating dimensions for the date keys in the factOrders table, minimize storage spacerequirements and optimize the cube processing time.Ensure that queries against the Sales database return the most current data in the data warehouse.Ensure that the SSAS model of the Finance database does not page to disk or return amemory error as the size of the database grows.Create an SSAS monitoring solution that tracks the following data: Queries answered per second Queries from cache direct per second Queries from file per second.---
