NEW QUESTION: 1A. Option B B. Option C C. Option D D. Option A **Answer: C** Explanation: Within EC2, when the user copies an AMI, the new AMI is fully independent of the source AMI; there is no link to the original (source. AMI. The user can modify the source AMI without affecting the new AMI and vice a versa. Therefore, in this case even if the source AMI is modified, the copied AMI of the EU region will not have the changes. Thus, after copy the user needs to copy the new source AMI to the destination region to get those changes.

NEW QUESTION: 2 Which of the following is the most reliable, secure means of removing data from magnetic storage media such as a magnetic tape, or a cassette? **A.** Parity Bit Manipulation **B.** Buffer overflow **C.** Degaussing **D.** Zeroization **Answer: C** Explanation: A "Degausser (Otherwise known as a Bulk Eraser) has the main function of reducing to near zero the magnetic flux stored in the magnetized medium. Flux density is measured in Gauss or Tesla. The operation is speedier than overwriting and done in one short operation. This is achieved by subjecting the subject in bulk to a series of fields of alternating polarity and gradually decreasing strength. The following answers are incorrect: Parity Bit Manipulation. Parity has to do with disk lerror detection, not data removal. A bit or series of bits appended to a character or block of characters to ensure that the information received is the same as the infromation that was sent. Zeroization. Zeroization involves overwrting data to sanitize it. It is time-consuming and not foolproof. The potential of restoration of data does exist with this method. Buffer overflow. This is a detractor. Although many Operating Systems use a disk buffer to temporarily hold data read from disk, its primary purpose has no connection to data removal. An overflow goes outside the constraints defined for the buffer and is a method used by an attacker to attempt access to a system. The following reference(s) were/was used to create this question: Shon Harris AIO v3. pg 908 Reference: What is degaussing.

NEW QUESTION: 3 A company uses Azure SQL Database to store data for an app. The data includes sensitive information. You need to implement measures that allow only members of the managers group to see sensitive information. Which two actions should you perform? Each correct answer presents part of the solution. NOTE: Each correct selection is worth one point. **A.** Option C **B.** Option E **C.** Option D **D.** Option A **E.** Option B **Answer: C, E** Explanation: Dynamic data masking helps prevent unauthorized access to sensitive data by enabling customers to

designate how much of the sensitive data to reveal with minimal impact on the application layer. SQL users excluded from masking - A set of SQL users or AAD identities that get unmasked data in the SQL query results. Note: The New-AzureRmSqlDatabaseDataMaskingRule cmdlet creates a data masking rule for an Azure SQL database.
