NEW QUESTION: 3You have an application running on Amazon EC2 in an Auto Scaling group. Instances are being bootstrapped dynamically, and the bootstrapping takes over 15 minutes to complete. You find that instances are reported by Auto Scaling as being In Service before bootstrapping has completed. You are receiving application alarms related to new instances before they have completed bootstrapping, which is causing confusion. You find the cause: your application monitoring tool is polling the Auto Scaling Service API for instances that are In Service, and creating alarms for new previously unknown instances. Which of the following will ensure that new instances are not added to your application monitoring tool before bootstrapping is completed?**A.** Create an Auto Scaling group lifecycle hook to hold the instance in a pending: wait state until your bootstrapping is complete. Once bootstrapping is complete, notify Auto Scaling to complete the lifecycle hook and move the instance into a pending: proceed state.**B.** Tag all instances on launch to identify that they are in a pending state. Change your application monitoring tool to look for this tag before adding new instances, and use the Amazon API to set the instance state to 'pending' until bootstrapping is complete.**C.** Increase the desired number of instances in your Auto Scaling group configuration

to reduce the time it takes to bootstrap future instances. **D.** Use the default Amazon Cloud Watch application metrics to monitor your application's health. Configure an Amazon SNS topic to send these Cloud Watch alarms to the correct recipients. **Answer: A** Explanation: Explanation Auto Scaling lifecycle hooks enable you to perform custom actions as Auto Scaling launches or terminates instances. For example, you could install or configure software on newly launched instances, or download log files from an instance before it terminates. After you add lifecycle hooks to your Auto Scaling group, they work as follows: 1. Auto Scaling responds to scale out events by launching instances and scale in events by terminating instances. 2. Auto Scaling puts the instance into a wait state (Pending:Wait or Terminating:Wait). The instance remains in this state until either you tell Auto Scaling to continue or the timeout period ends. For more information on rolling updates, please visit the below link: * <http://docs.aws.amazon.com/autoscaling/latest/userguide/lifecycle-hooks.html>
