NEW QUESTION: 1 When troubleshooting a Cisco ASA that is operating in multiple context mode, which two verification steps should be performed if a user context does not pass user traffic? (Choose two.)**A.** Verify the mac-address-table on the Cisco ASA.**B.** Verify the resource classes configuration by accessing the admin context.**C.** Verify that unique MAC addresses are configured if the contexts are using nonshared interfaces.**D.** Verify the interface status in the system execution space.**E.** Verify the interface status in the user context.**Answer: D,E**
Explanation:http://www.ciscopress.com/articles/article.asp?p=426641Packet Flow in Multiple ModeWhen the packets traverse through the security appliance in multiple mode, they are classified and forwardedto the right context. The packets are then processed based on the configured security policies on a context.TPacket ClassificationIn multiple mode, the security appliance must classify the packets to find outwhich context should operate onthem. The packet classification is done at the ingress interfacepoint that tags the packets using the source IPaddress, source port, destination IP address,destination port, and the interface or VLAN. The packet isprocessed based on the security policiesconfigured in that context.That said we need to note also that:System ConfigurationThe system administrator adds and manages contexts by configuring each context configuration location,allocated interfaces, and other context operating parameters in the system configuration, which, like a singlemode configuration, is the startup configuration. The system configuration identifies basic settings for thesecurity appliance. The system configuration does not include any network interfaces or network settings foritself; rather, when the system needs to access network resources (such as downloading the contexts from theserver), it uses one of the contexts that is designated as the admin context. The system configuration doesinclude a specialized failover interface for failover traffic only. Context ConfigurationsThe security appliance includes a configuration for each context that identifies the security policy, interfaces,and almost all the options you can configure on a standalone device. You can store context configurations onthe internal Flash memory or the external Flash memory card, or you can download them from a TFTP, FTP, orHTTP(S) server.

NEW QUESTION: 2ABC Corporation has recently hired a skilled wireless LAN security consultant to design, configure, install, and test a wireless LAN security implementation. The

security implementation consists of 802.1X/PEAP, IPSec, and SSH2 solutions using the strongest available encryption. The security policy is very strict about use of the software solutions, and all end users have been sufficiently trained. When an unauthorized user tries to access the corporate WLAN from the parking lot, he cannot circumvent the existing security solutions. What are the next two steps the unauthorized user could take in order to penetrate the system's security? (Choose two)**A.** Mount an email virus campaign to unlock access points from the wired LAN segment**B.** Place a rogue access point on ABC Corporation's network**C.** Perform a social engineering attack against help desk personnel**D.** Perform a distributed Internet crack against a single access point**E.** Perform an RF jamming attack against the WIPS **Answer: B,C**Explanation:Due to the level of security implemented, any attack against an access point will be futile. AnRF jamming attack will not penetrate the network, but rather it will deny network access toauthorized users. Since the security methods implemented require usernames and passwords,a social engineering attack could be possible. By placing a rogue access point on the wirednetwork, the wireless network can be successfully penetrated by circumventing existingsecurity mechanisms.
