NEW QUESTION: 4Your company hosts a web application in Azure. The company uses Azure Pipelines for the build and release management of the application.Stakeholders report that the past few releases have negatively affected system performance.You configure alerts in Azure Monitor.You need to ensure that new releases are only deployed to production if the releases meet defined performance baseline criteria in the staging environment first.What should you use to prevent the deployment of releases that fall to meet the performance baseline?**A.** a gate **B.** a trigger**C.** an Azure function**D.** an Azure Scheduler job**Answer: A**Explanation:Scenarios and use cases for gates include:* Quality validation. Query metrics from tests on the build artifacts such as pass rate or code coverage and deploy only if they are within required thresholds.Use Quality Gates to integrate monitoring into your pre-deployment or post-deployment. This ensures that you are meeting the key health/performance metrics (KPIs) as your applications move from dev to production and any differences in the infrastructure environment or scale is not negatively impacting your KPIs.Note: Gates allow automatic collection of health signals from external services, and then promote the release when all the signals are successful at the same time or stop the deployment on timeout. Typically, gates are used in connection with incident management, problem management, change management, monitoring, and external approval systems.References: <https://docs.microsoft.com/en-us/azure/azure-monitor/continuous-monitoring> <https://docs.microsoft.com/en-us/azure/devops/pipelines/release/approvals/gates?view=azure-devops>
