NEW QUESTION: 2An employee in the sales department completes a purchase requisition and forwards it to the purchaser. The purchaser places competitive bids and orders the requested items using approved purchase orders. When the employee receives the ordered items, she forwards the packing slips to the accounts payable department. The invoice for the ordered items is sent directly to the sales department, and an administrative assistant in the sales department forwards the invoices to the accounts payable department for payment. Which of the following audit steps best addresses the risk of fraud in the cash receipts process?**A.** Observe whether the purchase orders are sequentially numbered.**B.** Examine whether the sales department supervisor approves invoices for payment.**C.** Verify that approvals of purchasing documents comply with the authority matrix.**D.** Determine whether the accounts payable department reconciles all purchasing documents prior to payment.**Answer: B**

NEW QUESTION: 3Which of the following cryptography demands less computational power and offers more security per bit?**A.** Quantum cryptography**B.** Elliptic Curve Cryptography (ECC)**C.** Symmetric Key Cryptography**D.** Asymmetric Key Cryptography**Answer: B****Explanation:** Explanation/Reference:ECC demands less computational power and, therefore offers more security per bit. For example, an ECC with a 160-bit key offer the same security as an RSA based system with a 1024-bit key.ECC is a variant and more efficient form of a public key cryptography (how tom manage more security out of minimum resources) gaining prominence is the ECC. ECC works well on a network computer requires strong cryptography but have some limitation such as bandwidth and processing power. This is even more important with devices such as smart cards, wireless phones and other mobile devices.The following were incorrect answers: Quantum Cryptography - Quantum cryptography is based on a practical application of the characteristics of the smallest "grain" of light, photons and on physical laws governing their generation, propagation and detection. Quantum cryptography is the next generation of cryptography that may solve some of the existing problem associated with current cryptographic systems, specifically the random generation and secure distribution of symmetric cryptographic keys. Initial commercial usage has already started now that the

laboratory research phase has been completed. Symmetric Encryption - Symmetric encryption is the oldest and best-known technique. A secret key, which can be a number, a word, or just a string of random letters, is applied to the text of a message to change the content in a particular way. This might be as simple as shifting each letter by a number of places in the alphabet. As long as both sender and recipient know the secret key, they can encrypt and decrypt all messages that use this key. Asymmetric Encryption - The problem with secret keys is exchanging them over the Internet or a large network while preventing them from falling into the wrong hands. Anyone who knows the secret key can decrypt the message. One answer is asymmetric encryption, in which there are two related keys--a key pair. A public key is made freely available to anyone who might want to send you a message. A second, private key is kept secret, so that only you know it. Any message (text, binary files, or documents) that are encrypted by using the public key can only be decrypted by applying the same algorithm, but by using the matching private key. Any message that is encrypted by using the private key can only be decrypted by using the matching public key. This means that you do not have to worry about passing public keys over the Internet (the keys are supposed to be public). A problem with asymmetric encryption, however, is that it is slower than symmetric encryption. It requires far more processing power to both encrypt and decrypt the content of the message. NEW QUESTION: 4 After a server outage, a technician discovers that a physically damaged fiber cable appears to be the problem. After replacing the cable, the server will still not connect to the network. Upon inspecting the cable at the server end, the technician discovers light can be seen through one of the two fiber strands. Which of the following should the technician do FIRST to reconnect the server to the network? **A.** Replace the server's single-mode fiber cable with multimode fiber **B.** Move the fiber cable to different port on the switch where both strands function **C.** Reverse the fiber strands of the cable and reconnect them to the server **D.** Use a TDR to test both strands of a new replacement cable prior to connecting it to the server **Answer: C**
