NEW QUESTION: 1 Which two statements are true about the Oracle Cloud Infrastructure Object Storage Service? (Choose two.)
A. It can be directly attached or detached from a compute instance.
B. Data is stored redundantly across multiple availability domains (ADs) in a multi-AD region.
C. Data is stored redundantly only in a single AD.
D. It provides higher IOPS than Block Storage.
E. It provides strong consistency.
Answer: B, E
Explanation: STRONG CONSISTENCY When a read request is made, Object Storage always serves the most recent copy of the data that was written to the system. DURABILITY Object Storage is a regional service. Data is stored redundantly across multiple storage servers. Object Storage actively monitors data integrity using checksums and automatically detects and repairs corrupt data. Object Storage actively monitors and ensures data redundancy. If a redundancy loss is detected, Object Storage automatically creates more data copies. For more details about Object Storage durability, see the Oracle Cloud Infrastructure Object Storage FAQ. CUSTOM METADATA You can define your own extensive metadata as key-value pairs for any purpose. For example, you can create descriptive tags for objects, retrieve those tags, and sort through the data. You can assign custom metadata to objects and buckets using the Oracle Cloud Infrastructure CLI or SDK. See Software Development Kits and Command Line Interface for details. ENCRYPTION Object Storage employs 256-bit Advanced Encryption Standard (AES-256) to encrypt object data on the server. Each object is encrypted with its own key. Data encryption keys are encrypted with a master encryption key that is frequently rotated. Encryption is enabled by default and cannot be turned off.

NEW QUESTION: 3 You manage an application running on Azure Web Sites Standard tier. The application uses a substantial amount of large image files and is used by people around the world. Users from Europe report that the load time of the site is slow. You need to implement a solution by using Azure services. What should you do?
A. Configure Azure CDN to cache all responses from the application web endpoint.
B. Configure Azure blob storage with a custom domain.
C. Configure Azure CDN to cache site images and content stored in Azure blob storage.
D. Configure Azure Web Site auto-scaling to increase instances at high load.
Answer: B

Explanation: You can configure a custom domain for accessing blob data in your Azure storage account. The default endpoint for the Blob service is

<https://<mystorageaccount>.blob.core.windows.net>. If you map a custom domain and subdomain such as www.contoso.com to the blob endpoint for your storage account, then your users can also access blob data in your storage account using that domain. Reference:
