**NEW QUESTION: 1**How do you disable a specific version of NFS in ZFS storage appliance?**A.** Set another NFS version number (same version number) on both NFS minimum and maximum versions.**B.** Reduce the maximum number of concurrent NFS requests allowed.**C.** Disable the NFSv4 delegation.**D.** Enable iSNS discovery.**Answer:** CExplanation:Select this property to allow clients to cache files locally and make modifications without contacting the server. This option is enabled by default and typically results in better performance; but in rare circumstances it can cause problems. You should only disable thissetting after careful performance measurements of your particular workload and after validating that the setting has a measurable performance benefit. This option only affects NFSv4 mounts.

**NEW QUESTION: 2**What are two method of preventing DoS attacks on your network? (Choose two)**A.** Implement CWBQ on the perimeter router**B.** Disable the ICMP Unreachable response on the loopback and Null0 interfaces**C.** Increase the ICMP Unreachable massage rate limit interval.**D.** Implement shaping on the perimeter router.**E.** Decreases the ICMP Unreachable message interval**Answer:** A,C

**NEW QUESTION: 3**Which of the following is a telecommunication service designed for cost-efficient data transmission for intermittent traffic between local area networks (LANs) and between end-points in a wide area network (WAN)?**A.** Frame relay**B.** PPPC. ISDND. X.25**Answer:** AExplanation:Frame relay is a telecommunication service designed for cost-efficient data

transmission for intermittent traffic between local area networks (LANs) and between end-points in a wide area network (WAN). Frame relay puts data in a variable-size unit called a frame. It checks for lesser errors as compared to other traditional forms of packet switching and hence speeds up data transmission. When an error is detected in a frame, it is simply dropped. The end points are responsible for detecting and retransmitting dropped frames. Answer option C is incorrect. Integrated Services Digital Network (ISDN) is a digital telephone/telecommunication network that carries voice, data, and video over an existing telephone network infrastructure. It requires an ISDN modem at both the ends of a transmission. ISDN is designed to provide a single interface for hooking up a telephone, fax machine, computer, etc. ISDN has two levels of service, i.e., Basic Rate Interface (BRI) and Primary Rate Interface (PRI). Answer option A is incorrect. The Point-to-Point Protocol, or PPP, is a data link protocol commonly used to establish a direct connection between two networking nodes. It can provide connection authentication, transmission encryption privacy, and compression. PPP is commonly used as a data link layer protocol for connection over synchronous and asynchronous circuits, where it has largely superseded the older, non-standard Serial Line Internet Protocol (SLIP) and telephone company mandated standards (such as Link Access Protocol, Balanced (LAPB) in the X.25 protocol suite). PPP was designed to work with numerous network layer protocols, including Internet Protocol (IP), Novell's Internetwork Packet Exchange (IPX), NBF, and AppleTalk. Answer option D is incorrect. The X.25 protocol, adopted as a standard by the Consultative Committee for International Telegraph and Telephone (CCITT), is a commonly-used network protocol. The X.25 protocol allows computers on different public networks (such as CompuServe, Tymnet, or a TCP/IP network) to communicate through an intermediary computer at the network layer level. X.25's protocols correspond closely to the data-link and physical-layer protocols defined in the Open Systems Interconnection (OSI) communication model.
