NEW QUESTION: 2You have a table named Customers that has a clustered index defined on the ID column.You write a script to create a stored procedure.You need to complete the script for the stored procedure. The solution must minimize the number of locks and deadlocks.What should you do?To answer, drag the appropriate option to the correct location in the answer area. (Answer choices may be used once, more than once, or not at all.)Select and Place:

Answer: Explanation:Explanation/Reference:Note:* Optimized bulk load operations on heaps block queries that are running under the following isolation levels:SNAPSHOTREAD UNCOMMITTEDREAD COMMITTED using row versioning* READ COMMITTEDSpecifies that statements cannot read data that has been modified but not committed by other transactions. This prevents dirty reads. Data can be changed by other transactions between individual statements within the current transaction, resulting in nonrepeatable reads or phantom data. This option is the SQL Server default.* SERIALIZABLE (more locks)Specifies the following: Statements cannot read data that has been modified but not yet committed by other transactions. No other transactions can modify data that has been read by the current transaction until the current transaction completes.Other transactions cannot insert new rows with key values that would fall in the range of keys read by any statements in the current transaction until the current transaction completes.* UPDLOCKSpecifies that update locks are to be taken and held until the transaction completes. UPDLOCK takes update locks for read operations only at the row-level or page-level. If UPDLOCK is combined with TABLOCK, or a table-level lock is taken for some other reason, an exclusive (X) lock will be taken instead.When UPDLOCK is specified, the READCOMMITTED and READCOMMITTEDLOCK isolation level hints are ignored. For example, if the isolation level of the session is set to SERIALIZABLE and a query specifies (UPDLOCK, READCOMMITTED), the READCOMMITTED hint is ignored and the transaction is run using the SERIALIZABLE isolation level.* XLOCKSpecifies that exclusive locks are to be taken and held until the transaction completes. If specified with ROWLOCK, PAGLOCK, or TABLOCK, the exclusive locks apply to the appropriate level of granularity.
