NEW QUESTION: 1The implementations group has been using the test bed to do a 'proof-of-concept' that requires both Client 1 and Client 2 to access the WEB Server at 209.65.200.241. After several changes to the network addressing, routing scheme, DHCP services, NTP services, layer 2 connectivity, FHRP services, and device security, a trouble ticket has been opened indicating that Client 1 cannot ping the 209.65.200.241 address. Use the supported commands to isolated the cause of this fault and answer the following questions. What is the solution to the fault condition?
A. Enable OSPF authentication on the s0/0/0 interface using the ip ospf authentication message-digest command
B. Redistribute the BGP route into OSPF using the redistribute BGP 65001 subnet command.
C. Enable OSPF routing on the s0/0/0 interface using the network 10.1.1.0 0.0.0.255 area 12 command.
D. Enable OSPF routing on the s0/0/0 interface using the network 209.65.200.0 0.0.0.255 area 12 command.
Answer: A
Explanation: Explanation On R1, for IPV4 authentication of OSPF the command is missing and required to configure----- ip ospf authentication message-digest
Topic 4, Ticket 4 : BGP Neighbor Topology Overview (Actual Troubleshooting lab design is for below network design)* Client Should have IP 10.2.1.3* EIGRP 100 is running between switch DSW1 & DSW2* OSPF (Process ID 1) is running between R1, R2, R3, R4* Network of OSPF is redistributed in EIGRP* BGP 65001 is configured on R1 with Webserver cloud AS 65002* HSRP is running between DSW1 & DSW2 Switches
The company has created the test bed shown in the layer 2 and layer 3 topology exhibits. This network consists of four routers, two layer 3 switches and two layer 2 switches. In the IPv4 layer 3 topology, R1, R2, R3, and R4 are running OSPF with an OSPF process number 1. DSW1, DSW2 and R4 are running EIGRP with an AS of 10. Redistribution is enabled where necessary. R1 is running a BGP AS with a number of 65001. This AS has an eBGP connection to AS 65002 in the ISP's network. Because the company's address space is in the private range. R1 is also providing NAT translations between the inside (10.1.0.0/16 &

10.2.0.0/16) networks and outside (209.65.0.0/24) network. ASW1 and ASW2 are layer 2 switches. NTP is enabled on all devices with 209.65.200.226 serving as the master clock source. The client workstations receive their IP address and default gateway via R4's DHCP server. The default gateway address of 10.2.1.254 is the IP address of HSRP group 10 which is running on DSW1 and DSW2. In the IPv6 layer 3 topology R1, R2, and R3 are running OSPFv3 with an OSPF process number 6. DSW1, DSW2 and R4 are running RIPng process name RIP_ZONE. The two IPv6 routing domains, OSPF 6 and RIPng are connected via GRE tunnel running over the underlying IPv4 OSPF domain. Redistribution is enabled where necessary. Recently the implementation group has been using the test bed to do a 'proof-of-concept' on several implementations. This involved changing the configuration on one or more of the devices. You will be presented with a series of trouble tickets related to issues introduced during these configurations. Note: Although trouble tickets have many similar fault indications, each ticket has its own issue and solution. Each ticket has 3 sub questions that need to be answered & topology remains same.

Question-1 Fault is found on which device, Question-2 Fault condition is related to, Question-3 What exact problem is seen & what needs to be done for solution

Client is unable to ping IP 209.65.200.241

Solution Steps need to follow as below:-

- * When we check on client 1 & Client 2 desktop we are not receiving DHCP address from R4 ipconfig ----- Client will be receiving IP address 10.2.1.3
- * IP 10.2.1.3 will be able to ping from R4, R3, R2, R1
- * Look for BGP Neighbourship
- sh ip bgp summary ----- No O/P will be seen
- * Check for interface IP & ping IP 209.65.200.225 ----- Reply will be received from Webserver interface
- * Look for peering IP address via sh run on R1 interface serial 0/0/1
- * Since we are receiving icmp packets from Webserver interface on R1 so peering IP address under router BGP is configured wrong IP but with correct AS nos.
- * Change required: On R1 under router BGP Change neighbor 209.56.200.226 remote-as 65002 statement to neighbor 209.65.200.226 remote-as 65002

NEW QUESTION: 2 Refer to the exhibit. The links outside the TrustSec area in the given SGA architecture are unprotected. On which two links does EAC take place? (Choose two.)

A. between switch 1 and switch 5
B. between host 1 and switch 1
C. between switch 1 and switch 2
D. between switch 5 and host 2
E. between switch 2 and switch 3
F. between the authentication server and switch 4

Answer: D, E

Explanation: In TrustSec networks, packets are filtered at the egress, not the ingress to the network. In TrustSec endpoint authentication, a host accessing the TrustSec domain (endpoint IP address) is associated with a Security Group Tag (SGT) at the access device through DHCP snooping and IP device tracking. The access device transmits that association (binding) through SXP to TrustSec hardware-capable egress devices, which maintain a continually updated table of Source IP to SGT bindings. Packets are filtered on egress by the TrustSec hardware-capable devices by applying security group ACLs (SGACLs). Endpoint Admission Control (EAC) access methods for authentication and authorization can include the following:

- * 802.1X port-based Authentication
- * MAC Authentication Bypass (MAB)
- * Web Authentication (WebAuth)

EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).
