**NEW QUESTION: 1** If designing a single playbook to run across multiple Linux distributions that have distribution specific commands, what would be the best method to allow a successful run?  
**A.** Use the 'shell' module to write your own checks for each command that is ran.  
**B.** Use 'ignore\_errors: true' in the tasks.  
**C.** This isn't possible, a separate playbook for each target Linux distribution is required.  
**D.** Enable fact gathering and use the 'when' conditional to match the distribution to the task.  
**Answer: D**  
**Explanation:** Ansible provides a method to only run a task when a condition is met using the 'when' declarative. With gather facts enabled, the play has access to the distribution name of the Linux system, thus, tasks can be tailored to a specific distribution and ran only when the condition is met, e.g.:  
- when: ansible\_os\_family == "Debian"
