NEW QUESTION: 1 Which two loop-prevention mechanisms are implemented in BGP? (Choose two.)
A. The command `bgp allowas-in` enables a route with its own AS_PATH to be dropped when it reenters its own AS.
B. A route with its own cluster ID in the CLUSTER_LIST is dropped automatically when the route reenters its own AS.
C. The command `bgp bestpath as-path ignore` enables the strict checking of AS_PATH so that they drop routes with their own AS in the AS_PATH.
D. The command `bgp bestpath med missing-as-worst` assigns the smallest possible MED, which directly prevents a loop.
E. A route with its own AS in the AS_PATH is dropped automatically if the route reenters its own AS.
Answer: B, E
Explanation: When dealing with the possibility of routing updates making their way back into an AS, BGP relies on the information in the AS_path for loop detection. An update that tries to make its way back into the AS it was originated from will be dropped by the border router. With the introduction of route reflectors, there is a potential for having routing loops within an AS. A routing update that leaves a cluster might find its way back inside the cluster. Loops inside the AS cannot be detected by the traditional AS_path approach because the routing updates have not left the AS yet. BGP offers two extra measures for loop avoidance inside an AS when route reflectors are configured. Using an Originator ID
The originator ID is a 4-byte, optional, nontransitive BGP attribute (type code 9) that is created by the route reflector. This attribute carries the router ID of the originator of the route in the local AS. If, because of poor configuration, the update comes back to the originator, the originator ignores it. Using a Cluster List
The cluster list is an optional, nontransitive BGP attribute (type code 10). Each cluster is represented with a cluster ID. A cluster list is a sequence of cluster IDs that an update has traversed. When a route reflector sends a route from its clients to nonclients outside the cluster, it appends the local cluster ID to the cluster list. If the route reflector receives an update whose cluster list contains the local cluster ID, the update is ignored. This is basically the same concept as the AS_path list applied between the clusters inside the AS.

NEW QUESTION: 2 The Risk Contingency will:
A. reduce the probability of cost overruns.
B. increase the probability of scope changes.
C. reduce the probability of scope changes.
D. increase the probability of cost overruns.
Answer: A

NEW QUESTION: 3 Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is the same in each question in this series.
Start of repeated scenario
You have six workbook queries that each extracts a table from a Microsoft Azure SQL database. The tables are loaded to the data model, but the data is not loaded to any worksheet. The data model is shown in the Data Model

exhibit. (Click the Exhibit button.) Your company has 100 product subcategories and more than 10,000 products. End of repeated scenario. You need to create a measure named [Sales Monthly RT] that calculates a running total of [Sales] for each date within a month as shown in the following exhibit. **Answer:** Explanation: Explanation SUM([Sales], DATESMTD(DimDate[Date])) CALCULATE(SUM([Sales], DATESMTD(DimDate[Date])))
