**NEW QUESTION: 1** During the daily system health checkup, a customer found that their AAWG services are not running and they have to start it manually. What is the CLI shortcut command/script to restart the AAWG service? **A.** svc aawg restart **B.** svc cas restart **C.** service aawg start **D.** svc csa restart **Answer: D** Explanation: Explanation/Reference: Reference <https://downloads.avaya.com/css/P8/documents/101041361> (96)

**NEW QUESTION: 2** You are developing a Windows Application. New features that require changes to be made to the database schema are added to the application every week. You need to ensure that the changes made to the database schema do not require the application to be recompiled. Which 2 actions should you perform? **A.** Build a conceptual model and use it to access data from the business entities **B.** Modify the XML mapping file when the schema changes occur **C.** Modify the conceptual schema XML file when the schema changes occur **D.** Build a storage model and use it to access data from the business entities **Answer: A, B** Explanation: References: If you use the Entity Framework and might need to update the database structure without recompiling your application, choose to copy the model and mapping schemas to the build output directory rather than embedding them in the output assembly by selecting your model and setting Metadata Artifact Process to Copy To Output Directory. These three schemas work together to map a relational database to .NET classes. Within your project, they are defined within the .edmx file. When you build your project with Copy To Output Directory selected, the schemas will be created as three separate XML files as follows: **\*\* Store Schema Definition Language (SSDL) Describes the tables and fields in a database\*\*** **Conceptual Schema Definition Language (CSDL) Describes your .NET Framework classes\*\*** **Mapping Schema Language (MSL) Describes how the Common Language Runtime (CLR) will convert between the database described in the SSDL file and the classes described in the CSDL file.** By not compiling them into the assembly, you can update these files later and restart the application to adapt to changes in the underlying database. While you could update the files manually, it is easier to use the Visual Studio wizards to update the model, build the project, and use the updates files generated by Visual Studio.

**NEW QUESTION: 3** A company currently uses Amazon EBS and Amazon RDS for storage

purposes. The company intends to use a pilot light approach for disaster recovery in a different AWS Region. The company has an RTO of 6 hours and an RPO of 24 hours. Which solution would achieve the requirements with MINIMAL cost?  
**A.** Use EBS and RDS cross-region snapshot copy capability to create snapshots in the disaster recovery region. Use Amazon Route 53 with active-active failover configuration. Use Amazon EC2 in an Auto Scaling group with the capacity set to 0 in the disaster recovery region.  
**B.** Use AWS Lambda to create daily EBS and RDS snapshots, and copy them to the disaster recovery region. Use Amazon Route 53 with active-active failover configuration. Use Amazon EC2 in an Auto Scaling group configured in the same way as in the primary region.  
**C.** Use Amazon ECS to handle long-running tasks to create daily EBS and RDS snapshots, and copy to the disaster recovery region. Use Amazon Route 53 with active-passive failover configuration. Use Amazon EC2 in an Auto Scaling group with the capacity set to 0 in the disaster recovery region.  
**D.** Use AWS Lambda to create daily EBS and RDS snapshots, and copy them to the disaster recovery region. Use Amazon Route 53 with active-passive failover configuration. Use Amazon EC2 in an Auto Scaling group with the capacity set to 0 in the disaster recovery region.  
**Answer: D**
