**NEW QUESTION: 1** You develop an HTML application that is located at [www.adventure-works.com](#). The application must load JSON data from [www.fabrikam.com](#). You need to choose an approach for loading the data. What should you do? **A.** Use the jQuery getJSON method. **B.** Configure Cross-Origin Resource Sharing (CORS) on the servers. **C.** Load the data by using WebSockets. **D.** Design a REST URI scheme with multiple domains. **Answer: B**  
Explanation: \* Cross-origin resource sharing (CORS) is a mechanism that allows Javascript on a web page to make XMLHttpRequests to another domain, not the domain the Javascript originated from. Such "cross- domain" requests would otherwise be forbidden by web browsers, per the same origin security policy. CORS defines a way in which the browser and the server can interact to determine whether or not to allow the cross-origin request. [2] It is more powerful than only allowing same-origin requests, but it is more secure than simply allowing all such cross-origin requests. \* You must use Cross Origin Resource Sharing! It's not as complicated as it sounds... simply set your request headers appropriately... in Python it would look like:  

```
self.response.headers.add_header('Access-Control-Allow-Origin', '*');  
self.response.headers.add_header('Access-Control-Allow-Methods', 'GET, POST, OPTIONS');  
self.response.headers.add_header('Access-Control-Allow-Headers', 'X-Requested-With');  
self.response.headers.add_header('Access-Control-Max-Age', '86400');
```
