Which approach will resolve the encryption requirement?**A.** Encrypt the standby replica in the secondary Availability Zone and promote it to the primary instance.**B.** Create a new encrypted Amazon EBS volume and attach it to the instance.**C.** Take a snapshot of the RDS instance, copy and encrypt the snapshot, and then restore to the new RDS instance.**D.** Log in to the RDS console and select the encryption box to encrypt the database.**Answer: C****Explanation:** <https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Overview.Encryption.html#Overview.Encryption.Enabling> You can only enable encryption for an Amazon RDS DB instance when you create it, not after the DB instance is created. However, because you can encrypt a copy of an unencrypted DB snapshot, you can effectively add encryption to an unencrypted DB instance. That is, you can create a snapshot of your DB instance, and then create an encrypted copy of that snapshot. You can then restore a DB instance from the encrypted snapshot, and thus you have an encrypted copy of your original DB instance.
