Explanation: If you introduce some randomness in your key name prefixes, the key names, and therefore the I/O load, will be distributed across more than one partition. If you anticipate that your workload will consistently exceed 100 requests per second, you should avoid sequential key names. If you must use sequential numbers or date and time patterns in key names, add a random prefix to the key name. The randomness of the prefix more evenly distributes key names across multiple index partitions. Examples of introducing randomness are provided later in this topic.
