NEW QUESTION: 1 Which action can be taken on a multiaccess segment with OSPF speakers to reduce the performance impact during widespread convergence events? **A.** Enable LSA throttling in the core to slow link state advertisement updates during times of network instability. **B.** Verify that fewer than 50 OSPF speakers are on the segment. **C.** Ensure that the elected DR or BDR router can support high-volume convergence events. **D.** Separate the network into multiple areas for each new multiaccess segment. **Answer: A**
Explanation: "It is worth noting that three most important timers to tune network for sub-second convergence are the failure detection delay, initial LSA generation delay and initial SPF delay. All other timers, such as hold and maximum time serve the purpose of stabilizing network, and affect convergence in "worst-case" unstable network scenarios." More info on LSA throttling: https://www.cisco.com/c/en/us/td/docs/ios/12_0s/feature/guide/fsolsath.html Benefits of OSPF LSA Throttling Prior to the OSPF LSA Throttling feature, LSA generation was rate-limited for 5 seconds. That meant that changes in an LSA could not be propagated in milliseconds, so the OSPF network could not achieve millisecond convergence. The OSPF LSA Throttling feature is enabled by default and allows faster OSPF convergence (in milliseconds). This feature can be customized. One command controls the generation (sending) of LSAs and another command controls the receiving interval. This feature also provides a dynamic mechanism to slow down the frequency of LSA updates in OSPF during times of network instability."

NEW QUESTION: 2 When is the most appropriate time to escalate an issue that you troubleshooting? **A.** When you have gathered all information about an issue **B.** When a more urgent issue that requires your intervention is detected **C.** When you have been unable to resolve the issue after 30 min **D.** When you lack the proper to resolve the issue. **Answer: A**
