When you pass the ISTQB-CTFL exam which is well recognized wherever you are in any field, then acquire the ISTQB-CTFL certificate, the door of your new career will be open for you and your future is bright and hopeful.

NEW QUESTION: 1 Huawei OceanStor 9000 also needs to apply for temporary IP addresses for the back-end service network during the software installation process. Description, the correct one is: (multiple choice) **A.** It is also irrelevant that the IP addresses of the back-end storage networks of these temporary plans overlap with the IP addresses of the back-end storage networks actually planned by the nodes. **B.** These addresses are automatically deleted when the software installation is completed. **C.** Need to specify which node uses which IP address **D.** If the cluster has 6 nodes, you need to apply for 6 IP addresses. **Answer: C,D**

NEW QUESTION: 2

攻撃のどの段階で攻撃者がターゲットネットワーク上のデバイスを検出しますか？ **A.**

アクセスを保守する **B.** アクセスを保守する **C.** トラックをカバーする **D.** 認識 **Answer: D**

Explanation: Reconnaissance: This is the discovery process used to find information about the network. It could include scans of the network to find out which IP addresses respond, and further scans to see which ports on the devices at these IP addresses are open. This is usually the first step taken, to discover what is on the network and to determine potential vulnerabilities. Source: Cisco Official Certification Guide, Table 1-5 Attack Methods, p.13

NEW QUESTION: 3 **A.** Option D **B.** Option B **C.** Option C **D.** Option A **Answer: A,D** Explanation: A: The way to correct this problem is to first create two normal user accounts in AD. These are not service accounts. You could call them domainsuperuser and domainsuperreader, but of course that's up to you. The domainsuperuser account needs to have a User Policy set for that gives it Full Control to the entire web application. D: If you are using any type of claims based authentication you will need to use Windows PowerShell. And Windows PowerShell is the hipper more modern and sustainable option anyway. If you are using classic mode

authentication run the following cmdlets on one of your SharePoint servers: \$w = Get-SPWebApplication "http://<server>/" \$w.Properties["portalsuperuseraccount"] = "domainsuperuser" \$w.Properties["portalsuperreaderaccount"] = "domainsuperreader" \$w.Update() If you are using claims based authentication run these cmdlets on one of your SharePoint servers: \$w = Get-SPWebApplication "http://<server>/" \$w.Properties["portalsuperuseraccount"] = "i:0#.w|domainsuperuser" \$w.Properties["portalsuperreaderaccount"] = "i:0#.w|domainsuperreader" \$w.Update() Note: * If you have a SharePoint Publishing site and you check the event viewer every once in a while you might see the following warning in there: Object Cache: The super user account utilized by the cache is not configured. This can increase the number of cache misses, which causes the page requests to consume unnecessary system resources. To configure the account use the following command 'stsadm -o setproperty -propertynameportalsuperuseraccount -propertyvalue account urlwebappurl'. The account should be any account that has Full Control access to the SharePoint databases but is not an application pool account. Additional Data: Current default super user account: SHAREPOINTsystem This means that the cache accounts for your web application aren't properly set and that there will be a lot of cache misses. If a cache miss occurs the page the user requested will have to be build up from scratch again. Files and information will be retrieved from the database and the file system and the page will be rendered. This means an extra hit on your SharePoint and database servers and a slower page load for your end user. Reference: Resolving "The super user account utilized by the cache is not configured."
