A. From Internet Information Services (IIS) Manager, modify the connection strings of the WSUS website.
B. Run the iisreset.exe command.
C. Install a server certificate.
D. From Internet Information Services (IIS) Manager, modify the bindings of the WSUS website.
E. Run the wsusutil.exe command.
Answer: C, D, E Explanation:

<http://www.vkernel.ro/blog/configure-wsus-to-use-ssl> 1- first we need to request a certificate for the WSUS web site, so open IIS, click the server name, then open Server Certificates. On the Actions pane click Create Domain Certificate. 2- To add the signing certificate to the WSUS Web site in IIS 7.0 On the WSUS server, open Internet Information Services (IIS) Manager. Expand Sites, right-click the WSUS Web site, and then click Edit Bindings. In the Site Binding dialog box, select the https binding, and click Edit to open the Edit Site Binding dialog box. Select the appropriate Web server certificate in the SSL certificate box, and then click OK. Click Close to exit the Site Bindings dialog box, and then click OK to close Internet Information Services (IIS) Manager. 3- WSUSUtil.exe configuressl <FQDN of the software update point site system> (the name in your certificate) WSUSUtil.exe configuressl <Intranet FQDN of the software update point site system>. 4- The next step is to point your clients to the correct url, by modifying the existing GPO or creating a new one. Open the policy Specify intranet Microsoft update service location and type the new url in the form <https://YourWSUSserver>. The gpupdate /force command will just download all the GPO's and re-apply them to the client, it won't force the client to check for updates. For that you need to use wuauclt /detectnow.
