Some guidelines for configuring SwitchA & SwitchB:

Configuration Requirements for SwitchA- The VTP and STP configuration modes on SwitchA SW-A(config)#spanning-tree vlan should not be modified. 11-13,21-23 root primary- SwitchA needs to be the root switch for vlans 11,12, 13, 21, 22 and 23. All other vlans should be left at their default values

Configuration Requirements for SwitchB- Vlan 21, Name: Marketing, will support two servers attached to fa0/9 and fa0/10 name ...- Vlan 22, Name: Sales, will support two servers attached (VLANs must be created on to fa0/13 and fa0/14 both switches if not exist)- Vlan 23, Name: Engineering, will support two servers interface range Fa0/x - x attached to fa0/15 and fa0/16 switchport mode access- Access ports that connect to server should transition switchport access vlan immediately to forwarding state upon detecting the

spanning-tree portfast connection of a device.- SwitchB VTP mode needs to be the same as SwitchA. vtp mode transparent- SwitchB must operate in the same spanning tree mode spanning-tree mode rapid- as SwitchA. pvst- No routing is to be configured on SwitchB. interface vlan 1- Only the SVI vlan 1 is to be configured and it is to use ip address 192.168.1.11 address 192.168.1.11/24. 255.255.255.0 Inter-switch Connectivity Configuration Requirements:- For operational and security reasons SW-A(config)#interface range Fa0/3 - 4 trunking should be unconditional and Vlans SW-A(config-if)#no switchport mode access 1, 21, 22 and 23 should be tagged when SW-A(config-if)#no switchport access vlan traversing the trunk link. 98 //These two commands must be deleted to form a trunking link.SW-A(config-if)#switchport mode trunk SW-A(config-if)#switchport trunk nativevlan 99-----SW-B(config)#interface range Fa0/3 - 4 SW-B(config-if)#switchport trunk encapsulation dot1q (yes I can issued this command on this switch)SW-B(config-if)#switchport mode trunkSW-B(config-if)#switchport trunk nativevlan 99- The two trunks between SwitchA and SW-A(config)#interface range Fa0/3 - 4 SwitchB need to be configured in a mode SW-A(config-if)#channel-group 1 mode that allows for the maximum use of their active bandwidth for all vlans. This mode should SW-A(config-if)#channel-protocol lacp be done with a non-proprietary protocol, SW-A(config-if)#no shutdown with SwitchA controlling activation. ----- SW-B(config)#interface range Fa0/3 - 4 SW-B(config-if)#channel-group 1 mode passive SW-B(config-if)#channel-protocol lacp SW-B(config-if)#no shutdown-----Maybe the interface Port-channel 1 was configured on both switches so we don't configure it here. If not we have to configure them with "interface port-channel 1" command. Also you have to turn them up.- Propagation of unnecessary broadcasts SW-A(config)#interface range Fa0/3 - 4 should be limited using manual pruning on SW-A(config-if)#switchport trunk allowed this trunk link. vlan 1,21-23----- SW-B(config)#interface range Fa0/3 - 4SW-B(config-if)#switchport trunk allowed vlan 1,21-23 You may have to configure Interface Port-Channel on both switches. Check the configuration first, if it does not exist, use these commands:interface port-channel 1 switchport mode trunk switchport trunk native vlan 99 //this command will prevent the "Native VLAN mismatched" error on both switches switchport trunk allowed vlan 1,21-23,99 Some notes for this sim:+ You should check the initial status of both switches with these commands: show vtp status (transparent mode on switchA and we have to set the same mode on switchB), show spanning-tree [summary] (rapid-pvst mode on switchA and we have to set the same mode on switchB), show vlan (check the native vlan and the existence of vlan 99), show etherchannel 1 port-channel and show ip int brief (check if Port-channel 1 has been created and make sure it is up), show run (to check everything again).+ When using "int range f0/x - y" command hit space bar before and after "-" otherwise the simulator does not accept it.+ You must create vlan 99 for the switchB. SwitchA already have vlan 99 configured.+ At the end, you can try to ping from SwitchB to RouterA (you can get the IP on RouterA via the show cdp neighbors detail on SwitchA), not sure if it can ping or not. If not, you can use the "ip default-gateway 192.168.1.1" on SwitchB.+ The name of SwitchA and SwitchB can be swapped or changed so be careful to put your configuration into appropriate switch.
