NEW QUESTION: 1 You have two standalone Exchange Server 2016 servers. You perform daily full backups of the Exchange server databases. A user accidentally deletes some critical items. You need to restore the critical items. Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order. **Answer:** Explanation: Box 1: Create a recovery database. A recovery database (RDB) is a special kind of mailbox database that allows you to mount and extract data from a restored mailbox database as part of a recovery operation. RDBs allow you to recover data from a backup or copy of a database without disrupting user access to current data. Box 2: Restore the mailbox database. After you create an RDB, you can restore a mailbox database into the RDB by using a backup application or by copying a database and its log files into the RDB folder structure. Box 3: New-MailboxRestoreRequest with -Recovery Use the New-MailboxRestoreRequest cmdlet to restore a mailbox or items from the recovery database to a production mailbox. Note: A recovery database (RDB) is a special kind of mailbox database that allows you to mount and extract data from a restored mailbox database as part of a recovery operation. RDBs allow you to recover data from a backup or copy of a database without disrupting user access to current data. After you create an RDB, you can restore a mailbox database into the RDB by using a backup application or by copying a database and its log files into the RDB folder structure. Then you can use the New-MailboxRestoreRequest cmdlet to extract data from the recovered database. Once extracted, the data can then be exported to a folder or merged into an existing mailbox. NEW QUESTION: 3 Given the code fragment:

```
public class FileThread implements Runnable {
    String fName;
    public FileThread(String fName) { this.fName = fName; }
    public void run ()
        System.out.println(fName);}
    public static void main (String[] args) throws IOException,
        InterruptedException {
        ExecutorService executor = Executors.newCachedThreadPool();
        Stream<Path> listOfFiles = Files.walk(Paths.get("Java Projects"));
        listOfFiles.forEach(line -> {
```

```
executor.execute(new FileThread(line.getFileName().toString()));//line n1});
executor.shutdown();executor.awaitTermination(5, TimeUnit.DAYS); //line n2}}
```

A. A compilation error occurs at line n1.
B. The program throws a runtime exception at line n2.
C. The program prints files names concurrently.
D. The program prints files names sequentially.
Answer: B

NEW QUESTION: 4 Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets the stated goals. Refer to exhibit: Server1 has two virtual machines named VM1 and VM2 that run Windows Server 2016. VM1 connects to Private1. VM2 has two network adapters. You need to ensure that VM1 connects to the corporate network by using NAT. Solution: You connect VM2 to Private1 and External1. You install the Remote Access server on VM2, and you configure NAT in the Routing and Remote Access console. You configure VM1 and VM2 as the default gateway. Does this meet the goal?
A. Yes
B. No
Answer: B
