NEW QUESTION: 1 Clients are unable to access a company's API to obtain pricing data. An analyst discovers sources other than clients are scraping the API for data, which is causing the servers to exceed available resources. Which of the following would be BEST to protect the availability of the APIs?
A. IP whitelisting
B. Virtual private network
C. Web application firewall
D. Certificate-based authentication
Answer: C

NEW QUESTION: 2 Which of the following conditions is not a criterion for classifying a lease as a capital lease?
A. The lessee has the option of acquiring the asset at the end of the lease term at a bargain price.
B. The lease term is greater than three-quarters of the economic life of the asset.
C. The present value of the minimum lease payments is at least 75% of the fair value of the leased asset.
Answer: C
Explanation: The criterion is that the present value of the minimum net lease payments is at least 90% of the fair market value of the asset at the inception of the lease. Another criterion is "the lease transfers ownership in the leased asset to the lessee at the end of the lease term."

NEW QUESTION: 3 CORRECT TEXT A network associate is configuring a router for the weaver company to provide internet access. The ISP has provided the company six public IP addresses of 198.18.184.105 198.18.184.110. The company has 14 hosts that need to access the internet simultaneously. The hosts in the company LAN have been assigned private space addresses in the range of 192.168.100.17 192.168.100.30.
Answer: Explanation: The above named organisation has 14 hosts that need to access the internet simultaneously but were provided with just 6 public IP addresses from 198.18.184.105 to 198.18.184.110/29. In this case, you have to consider using NAT Overload (or PAT).
Doubleclick on the Weaver router to access the CLI
Router> enable
Router# configure terminal
First you should change the router's name to Weaver:
Router(config)# hostname Weaver
Create a NAT pool of global addresses to be allocated with their netmask:
Weaver(config)# ip nat pool mypool 198.18.184.105 198.18.184.110 netmask 255.255.255.248
Create a standard access control list that permits the addresses that are to be translated:
Weaver(config)# access-list 1 permit 192.168.100.16 0.0.0.15
Establish dynamic source translation, specifying the access list that was defined in the prior step:
Weaver(config)# ip nat inside source list 1 pool mypool overload
Finally, we should save all your work with the following command:
Weaver# copy running-config startup-config (Don't forget this)
Check your configuration by going to "Host for testing" and type:
C : > ping 192.0.2.114
The ping should work well and you will be replied from 192.0.2.114
This command translates all source addresses that pass access list 1, which means a source address from 192.168.100.17 to 192.168.100.30, into an address from the pool named mypool (the pool contains addresses from 198.18.184.105 to 198.18.184.110)
Overload keyword allows to map multiple IP addresses to a single registered IP address (many-to-one) by using different ports. The question said that appropriate interfaces have been configured for NAT inside and NAT outside statements. This is how to configure the NAT inside and NAT outside, just for your understanding:
Weaver(config)# interface fa0/0 Weaver(config-if)# ip nat inside Weaver(config-if)# exit
Weaver(config)# interface s0/0 Weaver(config-if)# ip nat outside Weaver(config-if)# end
