NEW QUESTION: 1 There are many wireless LAN scanners on the market such as NetStumbler, Kismet, MacStumbler, and others that can aid in finding the SSID of wireless LANs. In order to defeat the efforts of these scanners, some administrators configure their access points to stop broadcasting SSIDs in Beacons and not to respond to Probes with null (empty) SSID fields. Describe how wireless LAN protocol analyzers can circumvent this so-called "security" solution.
A. Wireless LAN protocol analyzers use a special driver, used to operate the card in promiscuous mode. Promiscuous mode is a special mode allowing the radio card to see raw data frames, instead of the filtered data frames that standard mode radio cards see.
B. Wireless LAN protocol analyzers using cards from the same manufacturer as the access point will always be able receive the SSID due to the proprietary chipset protocol extensions.
C. Wireless LAN protocol analyzers analyze all frames on a wireless LAN. Frame types other than Beacons and Probe Responses carry the SSID information.
D. Wireless LAN protocol analyzers send specialized Probe Requests to which 802.11 compliant access points are required to respond with a Probe Response containing the SSID information.
E. Wireless LAN protocol analyzer software puts the radio card driver into RF Monitor mode. This mode is recognized by access points as privileged, allowing them connectivity when it would otherwise be denied.
Answer: C
