Answer: D

NEW QUESTION: 4Answer: Explanation:ExplanationBox 1: READ_COMMITTED

READ COMMITTED specifies that statements cannot read data that has been modified but not committed by other transactions. This prevents dirty reads. Data can be changed by other transactions between individual statements within the current transaction, resulting in nonrepeatable reads or phantom data. This option is the SQL Server default. The behavior of READ COMMITTED depends on the setting of the READ_COMMITTED_SNAPSHOT database option Box 2: REPEATABLE_READ:REPEATABLE_READ specifies that statements cannot read data that has been modified but not yet committed by other transactions and that no other transactions can modify data that has been read by the current transaction until the current transaction completes. Shared locks are placed on all data read by each statement in the transaction and are held until the transaction completes. This prevents other transactions from modifying any rows that have been read by the current transaction. Box 3: SERIALIZABLE

SERIALIZABLE Specifies the following: Statements cannot read data that has been modified but not yet committed by other transactions. No other transactions can modify data that has been read by the current transaction until the current transaction completes. Other transactions cannot insert new rows with key values that would fall in the range of keys read by any statements in the current transaction until the current transaction completes. Reference:
