**NEW QUESTION: 2**  
**Answer:** Explanation:Explanation Box 1: Azure HDInsight MapReduce Azure Event Hubs allows you to process massive amounts of data from websites, apps, and devices. The Event Hubs spout makes it easy to use Apache Storm on HDInsight to analyze this data in real time. Box 2: Azure Event Hub Box 3: Azure Stream Analytics Stream Analytics is a new service that enables near real time complex event processing over streaming data. Combining Stream Analytics with Azure Event Hubs enables near real time processing of millions of events per second. This enables you to do things such as augment stream data with reference data and output to storage (or even output to another Azure Event Hub for additional processing).

**NEW QUESTION: 4**Which of the following BEST describes a protective countermeasure for SQL injection?**A.** Validating user input in web applications**B.** Installing an IDS to monitor network traffic**C.** Eliminating cross-site scripting vulnerabilities**D.** Placing a firewall between the Internet and database servers**Answer: A**Explanation:By validating user input and preventing special characters, we can prevent the injection of client-side scripting code. SQL injection is a code injection technique, used to attack data-driven applications, in which malicious SQL statements are inserted into an entry field for execution (e.g. to dump the database contents to the attacker). SQL injection must exploit a security vulnerability in an application's software, for example, when user input is either incorrectly filtered for string literal escape characters embedded in SQL statements or user input is not strongly typed and unexpectedly executed. SQL injection is mostly known as an attack vector for websites but can be used to attack any type of SQL database.
