NEW QUESTION: 1A university requires a significant increase in web and database server resources for one week, twice a year, to handle student registration. The web servers remain idle for the rest of the year. Which of the following is the MOST cost effective way for the university to securely handle student registration?**A.** Move the database servers and web servers to an elastic private cloud.**B.** Move the web servers to an elastic public cloud while keeping the database servers local.**C.** Virtualize the web servers locally to add capacity during registration.**D.** Move the database servers to an elastic private cloud while keeping the web servers local.**Answer: B****Explanation:**In cloud computing, elasticity is defined as the degree to which a system (or a particular cloud layer) autonomously adapts its capacity to workload over time.The dynamic adaptation of capacity, e.g., by altering the use of computing resources, to meet a varying workload is called "elastic computing". In general, an elastic cloud application or process has three elasticity dimensions, Cost, Quality, and Resources, enabling it to increase and decrease its cost, quality, or available resources, as to accommodate specific requirements.In this question, the web servers remain idle when they are not used for the rest of the year. Therefore, we should host the web servers in the elastic public cloud. This will be cost effective because we will not be charged for them while they are not in use. The database servers are not idle so they should be kept local.
