NEW QUESTION: 3

既存のデータベーステーブルを変更せずに、各データベースへの書き込みのパフォーマンスを最大化する必要があります。

以下の表で、各データベースに構成する必要があるデータベース設定を確認します。

注：各列で1つだけ選択してください。それぞれ正しい選択は1ポイントの価値があります。

Answer: **Explanation:** **Explanation:** DB1: DELAYED_DURABILITY=FORCED From scenario:

Thousands of records are inserted into DB1 or updated each second. Inserts are made by many different external applications that your company's developers do not control. You observe that transaction log write latency is a bottleneck in performance. Because of the transient nature of all the data in this database, the business can tolerate some data loss in the event of a server shutdown. With the DELAYED_DURABILITY=FORCED setting, every transaction that commits on the database is delayed durable. With the DELAYED_DURABILITY=ALLOWED

setting, each transaction's durability is determined at the transaction level. Note: Delayed transaction durability reduces both latency and contention within the system because: * The transaction commit processing does not wait for log IO to finish and return control to the client. * Concurrent transactions are less likely to contend for log IO; instead, the log buffer can be flushed to disk in larger chunks, reducing contention, and increasing throughput. DB2: ALLOW_SNAPSHOT_ISOLATION ON and READ_COMMITTED_SNAPSHOT ON Snapshot isolation enhances concurrency for OLTP applications. Snapshot isolation must be enabled by setting the ALLOW_SNAPSHOT_ISOLATION ON database option before it is used in transactions. The following statements activate snapshot isolation and replace the default READ COMMITTED behavior with SNAPSHOT: ALTER DATABASE MyDatabase SET ALLOW_SNAPSHOT_ISOLATION ON ALTER DATABASE MyDatabase SET READ_COMMITTED_SNAPSHOT ON Setting the READ_COMMITTED_SNAPSHOT ON option allows access to versioned rows under the default READ COMMITTED isolation level. From scenario: The DB2 database was migrated from SQL Server 2012 to SQL Server 2016. Thousands of records are updated or inserted per second. You observe that the WRITELOG wait type is the highest aggregated wait type. Most writes must have no tolerance for data loss in the event of a server shutdown. The business has identified certain write queries where data loss is tolerable in the event of a server shutdown.
