In order to help people pass the exam and gain the certification, we are glad to the JN0-683 study materials from our company for you, Every year there are a large number of people who can't pass the JN0-683 exam smoothly.

NEW QUESTION: 1Which security model ensures that actions that take place at a higher security level do not affect actions that take place at a lower level?**A.** The Clark-Wilson model**B.** The Bell-LaPadula model**C.** The information flow model**D.** The noninterference model**Answer: D****Explanation:**The goal of a noninterference model is to strictly separate differing security levels to assure that higher-level actions do not determine what lower-level users can see. This is in contrast to other security models that control information flows between differing levels of users, By maintaining strict separation of security levels, a noninterference model minimizes leakages that might happen through a covert channel.The model ensures that any actions that take place at a higher security level do not affect, or interfere with, actions that take place at a lower level.It is not concerned with the flow of data, but rather with what a subject knows about the state of the system. So if an entity at a higher security level performs an action, it can not change the state for the entity at the lower level.The model also addresses the inference attack that occurs when some one has access to some type of information and can infer(guess) something that he does not have the clearance level or authority to know.The following are incorrect answers:The Bell-LaPadula model is incorrect. The Bell-LaPadula model is concerned only with confidentiality and bases access control decisions on the classification of objects and the clearances of subjects.The information flow model is incorrect. The information flow models have a similar framework to the Bell-LaPadula model and control how information may flow between objects based on security classes. Information will be allowed to flow only in accordance with the security policy.The Clark-Wilson model is incorrect. The Clark-Wilson model is concerned with change control and assuring that all modifications to objects preserve integrity by means of well-formed transactions and usage of an access triple (subject - interface -

object).References:CBK, pp 325 - 326AIO3, pp. 290 - 291AIOv4 Security Architecture and Design (page 345)AIOv5 Security Architecture and Design (pages 347 - 348)

NEW QUESTION: 2When IIS is running multiple websites, what do you use to isolate one site from another website?**A.** virtual directories**B.** application pools**C.** applications**D.** sites**Answer: B**
Explanation:Explanation/Reference:Explanation:An application pool is a set of resources (a worker process or a set of worker processes) used by a website or application that defines the memory boundaries for the site. Forcing each application to have its own application pool ensures that one site does not interfere with another site on the same server, which ensures application performance and improved application availability. Therefore, if one application has a memory leak or crashes, it will not affect the other sites.

NEW QUESTION: 3技術者が3番目の電子メールサーバーのインストールと構成を完了しました。技術者は電子メールトラフィックを許可するようにファイアウォールを設定しましたが、メールは2つの古いサーバーでのみ受信されています。技術者が受信メールを3つのサーバーすべてで処理するように設定するには、次のうちどれですか？**A.** DNSのMXレコードを更新します。**B.** 新しいメールサーバーでIMAPを設定します。**C.** DHCPにDNSサーバーオプションを追加します。**D.** NTPを有効にすると、3つのサーバがすべて同期されます。**Answer: A**
