NEW QUESTION: 1When requesting a file, how does HDFS retrieves the blocks associated with that file?
A. the client polls the datanodes for the block ID's
B. the namenode requires the datanode for the block ID's
C. the namenode reads the block ID's from disk
D. The namenode reads the block ID's from memory
Answer: C
Explanation:Here is how a client RPC request to the Hadoop HDFS NameNode flows through the NameNode.The Hadoop NameNode receives requests from HDFS clients in the form of Hadoop RPC requests over a TCP connection. Typical client requests include mkdir, getBlockLocations, create file, etc. Remember - HDFS separates metadata from actual file data, and that the NameNode is the metadata server. Hence, these requests are pure metadata requests - no data transfer is involved.
