Dijkstra's shortest path algorithm. Examples of link state routing protocols are:Open Shortest Path First (OSPF) for IPThe ISO's Intermediate System to Intermediate System (IS-IS) for CLNS and IP DEC's DNA Phase V Novell's NetWare Link Services Protocol (NLSP) Although link state protocols are rightly considered more complex than distance vector protocols, the basic functionality is not complex at all:1. Each router establishes a relationship-an adjacency-with each of its neighbors.2. Each router sends link state advertisements (LSAs), some3. Each router stores a copy of all the LSAs it has seen in a database. If all works well, the databases in all routers should be identical.4. The completed topological database, also called the link state database, describes a graph of the internetwork. Using the Dijkstra algorithm, each router calculates the shortest path to each network and enters this information into the route table.OSPF Tutorial
