NEW QUESTION: 3 A 55-year-old female is receiving chemotherapy for metastatic carcinoma. She threatens to stop her treatment because of severe nausea and vomiting. The oncologist plans to use prochlorperazine to reduce the nausea and vomiting associated with chemotherapeutic agents. What is the mechanism of action of prochlorperazine? **A.** H2 receptor antagonist **B.** Cannabinoids related **C.** Serotonin 5-HT3 antagonist **D.** Blockage of prostaglandins **E.** Blocking dopamine receptors **Answer: E** Explanation: Explanation B: A variety of drugs have been found to be of some value in the prevention and treatment of vomiting, especially cancer chemotherapy-induced vomiting. With the exception of thioridazine, most of the neuroleptic drugs have antiemetic effects that are mediated by blocking D2 dopaminergic receptors of the chemoreceptor trigger zone of the medulla. Phenothiazines, such as prochlorperazine, were the first drugs shown to be effective antiemetic agents and act by blocking dopamine receptors. They are effective against low to moderately emetogenic chemotherapeutic agents (for example, fluorouracil and doxorubicin). Although increasing the dose improves antiemetic activity, side effects, including hypotension and restlessness, are dose limiting. Other adverse reactions include extrapyramidal symptom and sedation. A: Serotonin 5-HT3 antagonist is incorrect. The specific antagonists of the 5-HT3 receptor, ondansetron and granisetron, selectively block 5-HT3 receptors in the periphery and in the brain (chemoreceptor trigger zone). C: Cannabinoids related is incorrect. Cannabinoids are marijuana derivatives including dronabinol and nabilone and are effective against moderately emetogenic chemotherapy. However, they are seldom first-line antiemetics because of serious side effects. D: Blockage of prostaglandins is incorrect. Dexamethasone and methylprednisolone used alone are effective against mildly to moderately emetogenic chemotherapy. Their antiemetic mechanism is not known, but it may involve blockade of prostaglandins. E: H2 receptor antagonist is incorrect. Antagonists of histamine H2 receptor block the action of histamine at all H2 receptors; their

chief clinical use is as inhibitors of gastric acid secretion.

NEW QUESTION: 4You are deploying a custom Windows 7 system image to a new computer. You perform the following tasks:
*Start the new computer by using the Windows preinstallation Environment (WPE).
*Connect to a shared network location that contains the Windows 7 image file.
You need to apply the Windows 7 image to the computer. What should you do before you apply the image?
A. Configure and format the hard disk drive.
B. Configure Windows Firewall.
C. Initialize the Boot Configuration data (BCD) store.
D. Mount the image.
Answer: A
Explanation: Deploying from a Network Share
After you have imaged your reference installation, you can deploy the image onto new hardware (one or more destination computers). To access a network share as an installation source from the client computer, you need to boot the client computer into the Windows Preinstallation Environment (Windows PE) environment. The Windows PE environment is a minimally featured operating system that allows you to access diagnostic and maintenance tools as well as access network drives. To deploy an image from a network share, you use the Diskpart tool to format the hard drive of a destination computer. Then you copy the image from the network share and begin the installation by running Setup.exe.
