Clinical manifestations of urethritis are often difficult to distinguish from gonorrhea and include mucopurulent discharges of scant or moderate quantity, urethral itching, and burning on urination. Possible complications or sequelae of male urethral infections include epididymitis, infertility, and Reiter syndrome. In homosexual men, receptive anorectal intercourse might result in chlamydial proctitis. In women, the clinical manifestations might be similar to those of gonorrhea and frequently present as a mucopurulent endocervical discharge, with edema, erythema, and easily induced endocervical bleeding caused by inflammation of the endocervical columnar epithelium. However, up to 70% of sexually active women with chlamydial infections are asymptomatic. Complications and sequelae include salpingitis with subsequent risk of infertility, ectopic pregnancy, or chronic pelvic pain. Asymptomatic chronic infections of the endometrium and fallopian tubes might lead to the same outcome.**Physiological Adaptation**
