異なるPDBは異なるデフォルトブロックサイズを持つことができます。**G.**

ログスイッチは、マルチテナントコンテナデータベース (CDB) レベルでのみ発生します。

Answer: C,E,G Explanation: B: * A PDB would have its SYSTEM, SYSAUX, TEMP tablespaces. It can also contains other user created tablespaces in it. * There is one default temporary tablespace for the entire CDB. However, you can create additional temporary tablespaces in individual PDBs. D: * There is a single redo log and a single control file for an entire CDB * A log switch is the point at which the database stops writing to one redo log file and begins writing to another. Normally, a log switch occurs when the current redo log file is completely filled and writing must continue to the next redo log file. G: instance recovery The automatic application of redo log records to uncommitted data blocks when an database instance is restarted after a failure. Incorrect: Not A: * There is one set of background processes shared by the root and all PDBs. * High consolidation density. The many pluggable databases in a single container database share its memory and background processes, letting you operate many more pluggable databases on a particular platform than you can single databases that use the old architecture. Not C: There is a separate SYSAUX tablespace for the root and for each PDB. Not F: There is a separate SYSTEM tablespace for the root and for each PDB.
