NEW QUESTION: 1 Which security model uses division of operations into different parts and requires different users to perform each part?**A.** Biba model**B.** Bell-LaPadula model**C.** Clark-Wilson model**D.** Non-interference model**Answer: C**Explanation:The Clark-Wilson model uses separation of duties, which divides an operation intodifferent parts and requires different users to perform each part. This prevents authorized usersfrom making unauthorized modifications to data, thereby protecting its integrity.The Clark-Wilson integrity model provides a foundation for specifying and analyzing an integritypolicy for a computing system. The model is primarily concerned with formalizing the notion of information integrity. Informationintegrity is maintained by preventing corruption of data items in a system due to either error ormalicious intent. An integrity policy describes how the data items in the system should be keptvalid from one state of the system to the next and specifies the capabilities of various principals inthe system. The model defines enforcement rules and certification rules. The model's enforcement and certification rules define data items and processes that provide thebasis for an integrity policy. The core of the model is based on the notion of a transaction.A well-formed transaction is a series of operations that transition a system from one consistent state to another consistent state.In this model the integrity policy addresses the integrity of the transactions.The principle of separation of duty requires that the certifier of a transaction and the implementerbe different entities.The model contains a number of basic constructs that represent both data items and processesthat operate on those data items. The key data type in the Clark-Wilson model is a ConstrainedData Item (CDI). An Integrity Verification Procedure (IVP) ensures that all CDIs in the system arevalid at a certain state. Transactions that enforce the integrity policy are represented byTransformation Procedures (TPs). A TP takes as input a CDI or Unconstrained Data Item (UDI)and produces a CDI. A TP must transition the system from one valid state to another valid state.UDIs represent system input (such as that provided by a user or adversary). A TP must guarantee(via certification) that it transforms all possible values of a UDI to a "safe" CDI.In general, preservation of data integrity has three goals:Prevent data modification by unauthorized partiesPrevent unauthorized data modification by authorized partiesMaintain internal and external consistency (i.e. data reflects the real world)Clark-Wilson addresses all three rules but BIBA addresses only the first rule of intergrity.References:HARRIS, Shon, All-In-One CISSP Certification Fifth Edition, McGraw-Hill/Osborne, Chapter 5:Security Architecture and Design (Page 341-344).andhttp://en.wikipedia.org/wiki/Clark-Wilson_model

NEW QUESTION: 2 On a physical Dell EMC Unity system, what is the maximum size to which a UFS64 file system can be extended? **A.** 32 TB **B.** 128 TB **C.** 64 TB **D.** 256 TB **Answer: D**

NEW QUESTION: 3 You plan to migrate an Oracle database supporting an online transaction processing (OLTP) workload to an X5 Exadata Database Machine. The database machine is running database version 12.1.0.2. The source database has these attributes: Database version: 12.1.0 Byte order: Big Endian Database size: 24 TB You have decided to perform physical migration using the Transportable Tablespace method. Examine this list of possible steps to accomplish this task. 1. Create a new 12.1.0.2 Exadata-based database. 2. Export the source system metadata using Transportable Tablespace (TTS). 3. Transfer the files to the Database Machine and use the RMAN CONVERT command to change them to the little endian format. 4. Import the metadata into the target database. 5. Use the RMAN CONVERT to change the database files to the little endian format on the source system. Identify the required steps in the correct order. **A.** 1, 2, 3, 4 **B.** 1, 2, 5, 3, 4 **C.** 1, 2, 4, 5 **D.** 1, 2, 5, 4 **E.** 1, 2, 3, 4, 5 **F.** 1, 2, 5, 4, 3 **Answer: A**
Explanation: Step 1: 1. Create a new 12.1.0.2 Exadata -based database. Step 2: 2. Export the source system metadata using transportable Tablespace (TTS). Step 3: 3. Transfer the files to the Database Machine and use the RMAN CONVERT command to change them to the little endian format. Step 4: 4. Import the metadata into the target database. This method is often chosen when migrating between platforms with different endian formats, or in cases where physical re-organization is not necessary. The transportable tablespace method is generally mu
