NEW QUESTION: 1 Why is renaming activities considered to be one of the best practices? Options are :**A.** In case of an exception, to be able to find its source activity**B.** To easily understand the high-level business logic from a workflow**C.** To be able to understand the process logic without expanding each sequence or invoked workflow**Answer: B,C**

NEW QUESTION: 2

既存のデータベーステーブルを変更せずに、各データベースへの書き込みのパフォーマンスを最大化する必要があります。

以下の表で、各データベースに構成する必要があるデータベース設定を確認します。

注：各列で1つだけ選択してください。それぞれ正しい選択は1ポイントの価値があります。

Answer: Explanation:ExplanationDB1: DELAYED_DURABILITY=FORCEDFrom scenario: Thousands of records are inserted into DB1 or updated each second. Inserts are made by many different external applications that your company's developers do not control. You observe that transaction log write latency is a bottleneck in performance. Because of the transient nature of all the data in this database, the business can tolerate some data loss in the event of a server shutdown.With the DELAYED_DURABILITY=FORCED setting, every transaction that commits on the database is delayed durable.With the DELAYED_DURABILITY= ALLOWED setting, each transaction's durability is determined at the transaction level.Note: Delayed transaction durability reduces both latency and contention within the system because:* The transaction commit processing does not wait for log IO to finish and return control to the client.* Concurrent transactions are less likely to contend for log IO; instead, the log buffer can be flushed to disk in larger chunks, reducing contention, and increasing throughput.DB2: ALLOW_SNAPSHOT_ISOLATION ON and READ_COMMITTED_SNAPSHOT ONSnapshot isolation enhances concurrency for OLTP applications.Snapshot isolation must be enabled by setting

the ALLOW_SNAPSHOT_ISOLATION ON database option before it is used in transactions. The following statements activate snapshot isolation and replace the default READ COMMITTED behavior with SNAPSHOT: ALTER DATABASE MyDatabase SET ALLOW_SNAPSHOT_ISOLATION ON; ALTER DATABASE MyDatabase SET READ_COMMITTED_SNAPSHOT ON; Setting the READ_COMMITTED_SNAPSHOT ON option allows access to versioned rows under the default READ COMMITTED isolation level. From scenario: The DB2 database was migrated from SQL Server 2012 to SQL Server 2016. Thousands of records are updated or inserted per second. You observe that the WRITELOG wait type is the highest aggregated wait type. Most writes must have no tolerance for data loss in the event of a server shutdown. The business has identified certain write queries where data loss is tolerable in the event of a server shutdown. NEW QUESTION: 3 Refer to the exhibit. If a supplicant supplies incorrect credentials for all authentication methods configured on the switch, how will the switch respond? **A.** The switch will cycle through the configured authentication methods indefinitely. **B.** The supplicant will fail to advance beyond the webauth method. **C.** The authentication attempt will time out and the switch will place the port into VLAN 101. **D.** The authentication attempt will time out and the switch will place the port into the unauthorized state. **Answer: B** Explanation: Flexible authentication (FlexAuth) is a set of features that allows IT administrators to configure the sequence and priority of IEEE 802.1X, MAC authentication bypass (MAB), and switch-based web authentication (local WebAuth). Case 2: Order MAB Dot1x and Priority Dot1x MAB If you change the order so that MAB comes before IEEE 802.1X authentication and change the default priority so that IEEE 802.1X authentication precedes MAB, then every device in the network will still be subject to MAB, but devices that pass MAB can subsequently go through IEEE 802.1X authentication. Special consideration must be paid to what happens if a device fails IEEE 802.1X authentication after successful MAB. First, the device will have temporary network access between the time MAB succeeds and IEEE 802.1X authentication fails. What happens next depends on the configured event-fail behavior. If next-method is configured and a third authentication method (such as WebAuth) is not enabled, then the switch will return to the first method (MAB) after the hold period. MAB will succeed, and the device will again have temporary access until and unless the supplicant tries to authenticate again. If next-method failure handling and local WebAuth are both configured after IEEE 802.1X authentication fails, local WebAuth ignores EAPoL-Start commands from the supplicant. MAB --> MAB Pass --> Port Authorized by MAB --> EAPoL-Start Received --> IEEE 802.1x MAB --> MAB Fail --> IEEE 802.1x (config-if)#authentication order mab dot1x (config-if)#authentication priority dot1x mab Source:
